UNIVERSITY PRESS

Contents

1	Thermodynamics of irreversible processes	1
1.1	Fundamental concepts	1
1.1.1	Space and time scales of observation	1
1.1.2	Local thermodynamic equations	2
1.1.3	Electrolyte solutions	4
1.2	Balance equations	7
1.2.1	Introduction	7
1.2.2	General form of the balance equations	9
1.2.3	Total and component mass-balance equations	13
1.2.4	Electric charge-balance equation	14
1.2.5	Linear momentum-balance equation	16
1.2.6	Energy- and entropy-balance equations in a non-viscous fluid	20
1.2.7	Energy- and entropy-balance equations in a Newtonian viscous fluid	24
1.2.8	Electromagnetic energy and linear momentum	27
	Exercises	34
	References	36
2	Transport equations	38
2.1	Linear phenomenological equations	38
2.1.1	Introduction	38
2.1.2	Ionic transport equations	39
2.1.3	Binary electrolyte solution	42
2.1.4	Electric conduction	44
2.1.5	Component transport equations	44
2.1.6	Ternary electrolyte solutions	46
2.2	The Fickian approach	47
2.2.1	Introduction	47
2.2.2	Fick's law	47
2.2.3	Diffusion-conduction equations	49
2.3	The Nernst–Planck approximation	50
2.3.1	Introduction	50
2.3.2	Nernst–Planck equation	51
2.3.3	Electrical coupling between the ionic fluxes	52
2.3.4	Diffusion potential	54
2.3.5	Integration of the transport equations in multi-ionic solutions	56

2.3.6	Binary electrolyte solution	57
2.3.7	Ternary electrolyte solutions	58
2.3.8	Weak electrolytes	61
2.3.9	Moderately concentrated solutions	63
2.4	The Stefan-Maxwell approach	64
2.4.1	Introduction	64
2.4.2	Diffusion of a neutral component	65
2.4.3	Binary electrolyte solution	66
2.4.4	Multi-ionic systems	69
	Exercises	70
	References	76
3	Transport at electrodes	78
3.1	Faraday's law	78
3.2	Electrode processes in stationary state	80
3.2.1	Nernst diffusion boundary layer	80
3.2.2	Limiting current density	81
3.2.3	Transport equations in multi-ionic solutions	82
3.2.4	Trace ions	83
3.2.5	Solutions with only one electroactive ion	84
3.2.6	Solutions with several electroactive species	89
3.2.7	Transport in spherical geometry	95
3.3	Hydrodynamic electrodes	98
3.3.1	Rotating-disc electrode	98
3.3.2	Channel-flow electrode	105
3.3.3	Wall-jet electrode	107
3.4	Non-stationary or transient electrode processes	110
3.4.1	Introduction	110
3.4.2	Current step in the absence of mixing	112
3.4.3	Current step with mixing	115
3.4.4	Current scan	118
3.4.5	Voltage step	120
	Exercises	122
	References	124
4	Transport in membranes	126
4.1	Transport across neutral porous membranes	126
4.1.1	Quasi-steady diffusive transport between two closed compartments	126
4.1.2	Lag time in diffusion	129
4.1.3	Iontophoretic enhancement	133
4.1.4	Lag time in electrodiffusion	136
4.1.5	Circulation of compartments	139
4.1.6	Convective electrophoresis	140
4.1.7	Liquid-junction potential	143
4.1.8	Uphill transport	148

4.2	Donnan equilibrium in charged membranes	152
4.2.1	Ion-exchange membranes	152
4.2.2	Donnan equilibrium	152
4.2.3	Ion-exchange equilibrium	157
4.2.4	Electrical double layer at the membrane/ external solution interface	160
4.2.5	Influence of the membrane heterogeneities	163
4.3	Steady-state transport across ion-exchange membranes	167
4.3.1	Transport coefficients and their equilibrium values	167
4.3.2	The diffusion–conduction flux equation inside charged membranes	170
4.3.3	Diffusion of a binary electrolyte	173
4.3.4	Membrane permselectivity	182
4.3.5	Counterion interdiffusion through an ideally permselective membrane	191
4.3.6	Bi-ionic potential	195
4.3.7	Transport in multi-ionic solutions	196
4.3.8	Concentration polarization in ion-exchange membrane systems	199
4.3.9	Influence of the diffusion boundary layers on the permselectivity	202
4.4	Steady-state transport across charged porous membranes	205
4.4.1	The radial electrical double layer	205
4.4.2	Electro-osmotic convection	212
4.4.3	Transport mechanisms in charged porous membranes	217
4.4.4	Theoretical approaches for describing transport in porous membranes	219
	Exercises	221
	References	229
