Diffuse Scattering and Defect Structure Simulations

A cook book using
the program DISCUS

Reinhard B. Neder

Department of Physics, University of Erlangen-Nürnberg

Thomas Proffen

Los Alamos National Laboratory

INTERNATIONAL UNION OF CRYSTALLOGRAPHY

Contents

1	Introduction	1
2	How to run DISCUS	3
3	Making computer crystals	7
3.1	Storing the structure	7
3.2	Small assemblies of atoms	8
3.3	Generating the unit cell	14
3.4	Generating extended crystal structures	19
3.5	Unit cell transformations	21
3.6	General symmetry operations	24
3.7	Creating molecules	27
3.8	Example: Distorted perovskite	28
3.9	Bibliography	32
4	Simulating experimental data	35
4.1	Single-crystal scattering	35
4.1.1	Finite size effects	36
4.1.2	Coherence	38
4.2	Powder diffraction	39
4.2.1	Complete integration	40
4.2.2	Debye formula	41
4.3	Atomic pair distribution function	43
4.3.1	Calculating the PDF from a model	43
4.3.2	Modeling of thermal motion	45
4.4	Properties of the Fourier transform	48
4.5	Bibliography	49
5	Correlations and creating short-range order	53
5.1	What are correlations?	53
5.2	Monte Carlo simulations	54
5.3	Creating chemical short-range order	55
5.4	Creating displacement disorder	56
5.4.1	Simple spring	56
5.4.2	Lennard-Jones potential	56
5.4.3	Bond angles	57
5.5	Example: Chemical short-range order	57

5.6	Example: Distortions	62
5.7	Bibliography	65
6	Creating modulations	69
6.1	Density waves	70
6.2	Displacement waves	75
6.3	Finite waves	79
6.4	Pitfalls when simulating modulations	84
6.5	Bibliography	85
7	Creating structures with stacking faults	87
7.1	Types of stacking faults	87
7.1.1	Growth faults	88
7.1.2	Deformation faults	89
7.1.3	Stacking fault parameters	89
7.2	Notations for stacking sequences	90
7.3	Reciprocal space of layered structures	91
7.4	Algorithms to simulate stacking faults	93
7.4.1	Growth faults	94
7.4.2	Deformation faults	95
7.4.3	Ordering of faults	96
7.5	Example: Growth faults	97
7.6	Example: Deformation faults	101
7.7	Example: Wurtzite and zinblende structures	103
7.8	Example: Short-range ordered faults	104
7.9	Bibliography	108
8	Creating domain structures	113
8.1	Introduction	113
8.2	Domain types	114
8.3	Definitions for a domain	115
8.4	Ordering and distribution of domains	121
8.5	Domain formation in Perovskites	124
8.6	Example: Urea inclusion compounds	128
8.7	Bibliography	135
9	Creating nanoparticles	139
9.1	Overview	139
9.2	Creating simple particles	140
9.3	PDF of nanoparticles	145
9.4	Creating core-shell particles	150
9.5	Carbon nanotubes	156
9.6	Bibliography	159
10	Analyzing disordered structures	161
10.1	Visualizing structures	161
10.2	Occupancies	165
10.3	Finding neighbors	166
10.4	Distortions	167

10.5	Calculating correlations	168
10.5.1	Occupational correlations	168
10.5.2	Displacement correlations	170
10.5.3	Correlation fields	171
10.6	Bond valence sums	171
10.7	Bibliography	172
11	Refining disordered structures	175
11.1	Reverse Monte Carlo method	175
11.2	Length-scale dependent PDF refinements	178
11.3	Refining parameters of a disorder model	180
11.3.1	The program DIFFEV	183
11.3.2	Required size of the simulated structure	186
11.3.3	Example: Simple disordered structure	188
11.3.4	Example: ZnSe Nanoparticles	195
11.4	Bibliography	201
A	Appendix	205
A.1	Contents of the CD-ROM	205
A.2	Installation	205
A.3	Functional list of commands	207
A.4	Answers to exercises	210
A.5	DISCUS bibliography	222
	Index	227
