<i>Preface</i>	ix
<i>Acknowledgements</i>	xi

PART I INTRODUCTION AND OVERVIEW

1. Introduction	3
1.1 Crystal growth	4
1.2 Diffraction techniques	6
1.2.1 X-rays	6
1.2.2 Neutrons	7
1.3 Crystal volume and quality	9
1.3.1 Short-range order (intermolecular)	10
1.3.2 Long-range order (domain structure)	14
1.3.3 The combination of short- and long-range order	16
1.4 Chapter summary	17

PART II CRYSTALLIZATION

2. Crystallization theory	21
2.1 Chapter summary	23
3. Practical methods of crystallization	24
3.1 Batch	24
3.2 Vapour diffusion	25
3.3 Dialysis	26
3.4 Free interface diffusion	26
3.5 Converting between methods	27
3.6 Chapter summary	28
4. Screening	29
4.1 Screens: problems and new developments	29
4.2 Automation and miniaturization of screening procedures	33
4.2.1 The effect of high-throughput: crystallization robotics	34
4.2.2 Analysis of large quantities of crystallization data	34
4.2.3 Experiment volume considerations	37
4.2.4 Imaging and monitoring of crystallization trials	37
4.3 Chapter summary	37

5. Optimization	38
5.1 Practical uses of the crystallization phase diagram	38
5.2 Methods for separating nucleation and growth	40
5.2.1 <i>Seeding</i>	41
5.2.2 <i>Dilution techniques</i>	42
5.3 The application of light-scattering techniques	44
5.3.1 <i>Static light scattering</i>	44
5.3.2 <i>Dynamic light scattering</i>	45
5.4 Chapter summary	47
6. Strategies to apply when high-quality crystals cannot be obtained	48
6.1 Introduction	48
6.2 Non-covalent modification of the sample	48
6.3 Covalent modification of the sample	49
6.3.1 <i>Reductive methylation</i>	49
6.3.2 <i>General chemical modification</i>	50
6.4 Mutagenesis, domain refinement and homologues	50
6.4.1 <i>Surface-entropy reduction</i>	50
6.4.2 <i>Proteolysis</i>	51
6.4.3 <i>Orthologues and homologues</i>	51
6.5 Antibody fragments	52
6.6 Chapter summary	52
7. Membrane proteins	53
7.1 Introduction	53
7.2 Crystallization	53
7.2.1 <i>Screening with detergents</i>	55
7.2.2 <i>Lipidic cubic-phase crystallization</i>	55
7.2.3 <i>Antibody fragment approaches</i>	56
7.3 Characterization using neutron-enhanced contrast	56
7.4 Chapter summary	56
8. Alternative approaches	58
8.1 Gel growth	58
8.2 Microgravity	59
8.2.1 <i>Interferometry</i>	59
8.2.2 <i>Depletion zone</i>	60
8.3 Microfluidics	61
8.4 Magnetic and electric fields	62
8.5 Chapter summary	64

PART III DIFFRACTION

9.	Experimental aspects	67
9.1	The diffraction pattern	67
9.2	Structural detail	70
9.3	Determining structure when the resolution is not ideal	72
9.4	How accurate is the structure?	73
9.5	Chapter summary	76
10.	Analysis of the molecular short-range order	78
10.1	Structural data	78
10.2	Thermal motion and diffuse scattering	79
10.2.1	<i>Diffuse scattering as a source of measurement error in the Bragg intensities</i>	81
10.3	Chapter summary	82
11.	Analysis of long-range order	83
11.1	Reflection profiling	83
11.2	Topography	88
11.2.1	<i>Photography-based topography</i>	89
11.2.2	<i>Digital-based topography</i>	90
11.3	Reciprocal-space mapping	91
11.4	Combinational analysis and chapter summary	94
12.	Macromolecular crystals and twinning	96
12.1	Historical examples	97
12.2	Types of twinning	98
12.3	The twin fraction and testing for twinned data	102
12.4	Using twinned data	104
12.5	Overcoming twinning in crystals	105
12.6	How prevalent is twinning?	109
12.7	Chapter summary	110
13.	Other macromolecular crystal diffraction disorders	112
13.1	Introduction	112
13.2	Case studies	112
13.3	Chapter summary	118
14.	Degradation and improvement of crystal perfection	119
14.1	Ageing	119
14.2	Radiation damage	119
14.3	Cryo-cooling	124
14.4	Dehydration and humidity control	127
14.5	Chapter summary	131

15. Unusual diffraction geometries	132
15.1 Chapter summary	136
16. Making the most of difficult crystals – beamline and detector optimization	137
16.1 Introduction	137
16.2 Geometry and end-station instrumentation	137
16.3 Signal and noise considerations	138
16.4 Very small crystal volume ‘microcrystals’	143
16.5 Phasing and the available instrumentation	147
16.6 Robotics, telepresence and remote access	148
16.7 More specialized applications	149
16.8 Chapter summary	150
17. Protein powders – making the most of tiny crystallites in bulk	151
17.1 Introduction	151
17.2 Quantitative protein powder analyses have opened up in recent years	152
17.3 Structure determination of unknown proteins?	154
17.4 Characterization of protein crystal polymorphism	155
17.5 Chapter summary	156
18. Complementary techniques	158
18.1 Chapter summary	159

PART IV THE FUTURE

19. The X-ray laser and the single molecule – no crystal needed?	163
20. Overall summary and future thoughts	168
Glossary of abbreviations, terms and symbols	170
Abbreviations	170
<i>General</i>	170
<i>Synchrotron sources</i>	171
<i>Neutron sources</i>	171
Terms	171
<i>Crystallization</i>	171
<i>X-ray analysis</i>	172
Symbols	173
<i>Crystallization and crystal-growth-monitoring symbols</i>	173
<i>Diffraction symbols</i>	174
References	175
Index	219
