Contents

Part I: The basic principles and experimental configurations of neutron diffraction experiments	1
I-1. Introduction to the book	1
I-2. A brief review of the physics of neutrons and neutron diffraction	3
I-2.1. Basic properties of neutrons	3
I-2.1.1. Mass	4
I-2.1.2. Charge	6
I-2.1.3. Spin	6
I-2.1.4. Magnetic moment	6
I-2.2. Neutron-scattering length	7
I-2.3. Neutron absorption	10
I-2.4. Summary of the comparison of neutron and X-ray diffraction phenomena	11
I-2.5. Summary of the specific features of the interactions between neutrons and bio-macromolecules	12
I-2.6. Prerequisite concepts for understanding this book	13
I-2.7. The basic principles for analysis of the structure of single crystals	13
I-3. The production of neutrons	17
I-3.1. Steady-state reactor neutron sources: fission from nuclear criticality	18
I-3.2. Pulsed, accelerator-driven neutron sources: spallation from energetic protons	18
I-4. The moderation of neutrons	19
I-5. The transport of neutrons	22
I-5.1. Neutron beam tubes	22
I-5.2. Neutron bandpass filters (for reactor sources)	24
I-5.2.1. Narrow-bandpass wavelength filters (monochromators)	24
I-5.2.2. Wide-bandpass wavelength filters and the quasi-Laue method	27
I-5.3. Neutron choppers and the time-of-flight method (for accelerator-driven spallation sources)	27
I-5.3.1. The time-of-flight (TOF) method	27
I-5.3.2. The time analyzer	29
I-5.3.3. The TOF single-crystal diffractometer	30

I-5.3.4. Summary: characteristics of the TOF method	32
I-6. The detection of neutrons	32
I-6.1. The physics of detecting neutrons	32
I-6.2. Types of detectors	35
I-6.2.1. Gas-proportional detectors	36
I-6.2.1.1. The resistive-wire type of PSD, based on the gas-proportional detector	36
I-6.2.1.2. The multi-anodes type of PSD, based on the gas-proportional detector	37
I-6.2.2. Scintillator detectors	38
I-6.2.2.1. The encode type of PSD, based on the scintillator detector	38
I-6.2.2.2. The wavelength-shift-fiber type of PSD, based on the scintillator detector	38
I-6.2.2.3. The Anger-camera type of PSD, based on the scintillator detector	40
I-6.2.3. Image-plate detectors	40
I-6.2.4. Comparison of the types of detectors	41
I-7. Summary comparison of the use of reactor sources and pulsed sources for neutron diffraction experiments	43
Part II: Experimental procedure for neutron protein crystallography	50
II-1. Flow chart of the experimental procedure for neutron protein crystallography	50
II-2. Crystallization	51
II-2.1. Crystallization phase diagram (CPD)	52
II-2.2. How to determine a CPD	53
II-2.2.1. Dialysis method	53
II-2.2.2. Vapor-diffusion method	54
II-2.2.3. Determination of a solubility curve (SC)	57
II-2.2.4. A special device for determination of a CPD	57
II-2.3. Two examples of CPDs	59
II-2.4. A comment about crystallization on the basis of a CPD	60
II-2.5. How to grow a large single crystal	60
II-2.5.1. Dialysis method	61
II-2.5.2. Vapor-diffusion method	62

II-3. Assessment of the quality of crystals	63
II-3.1. Introduction	63
II-3.2. Choosing a proper metric for judging the quality of crystals	64
II-3.3. Two examples of using the B-factor from the Wilson plot to judge crystal quality	69
II-3.3.1. B-DNA decamer d(CCATTAAATGG)	69
II-3.3.2. Hen egg-white lysozyme (HEWL)	73
II-4. New techniques for sample preparation	74
II-4.1. Deuteration	74
II-4.2. Neutron crystallography at cryogenic temperatures (~15 K)	75
II-4.3. High-pressure cooling of protein crystals without cryo-protectant	76
II-5. Diffractometers	77
II-5.1. Comments about diffractometers in general	77
II-5.2. The BIX type of diffractometer	78
II-5.3. The quasi-Laue type of diffractometer	81
II-5.4. The TOF type of diffractometer	83
II-5.4.1. The Protein Crystallographic Station (PCS) diffractometer at the LANSCE pulsed neutron source	83
II-5.4.2. The Ibaraki Biological Crystal Diffractometer (iBIX) at J-PARC	84
II-5.4.3. The Macromolecular Neutron Diffractometer (MaNDi) at SNS	87
II-5.5. A comparison of existing diffractometers	88
II-6. Conducting the diffraction experiment	90
II-6.1. Mounting and aligning a crystal	90
II-6.2. Estimating the minimum required irradiation time	92
II-7. Neutron data processing	93
II-7.1. General view	93
II-7.2. Integrated intensity of Bragg reflections	93
II-7.2.1. Background subtraction	94
II-7.2.2. Lorentz-factor correction	97
II-7.2.3. $i(\lambda)$ and detector-efficiency corrections	97
II-7.2.4. Absorption and extinction corrections	97
II-7.3. Completeness and resolution	98
II-7.4. Example 1: RNase A, analyzed with the BIX diffractometer	99
II-7.4.1. Data collection	99
II-7.4.2. Data processing	99
II-7.5. Example 2: Antifreeze protein, analyzed with the LADI diffractometer	101

II-7.5.1.	Crystal data	101
II-7.5.2.	Data collection	101
II-7.5.3.	Data processing	102
II-8.	Structure determination	103
II-8.1.	The initial model	103
II-8.2.	The analysis program	104
II-8.3.	The determination of mobile hydrogen atoms	105
II-8.3.1.	Hydrogen atoms in methyl groups	106
II-8.3.2.	Amide hydrogen atoms in the backbone	108
II-8.4.	The determination of protonation states	108
II-8.5.	The determination of hydrogen (deuterium) atoms in water molecules	109
II-8.6.	Improvements in the visibility of hydrogen atoms	112
II-8.7.	The determination of the H/D exchange ratios	115
II-8.8.	XN joint refinement	116
Part III:	Hydrogen, protons, and hydration in bio-macromolecules	124
III-1.	History of NPC	124
III-2.	Observation of hydrogen atoms in macromolecules	125
III-3.	Hydrogen and Hydration Protein Data Base (HHDB)	127
III-3.1.	General view	127
III-3.2.	Classification of the visibility of hydrogen atoms	129
III-3.3.	Methyl CH ₃ group configuration	129
III-4.	Hydrogen bonds	133
III-4.1.	General comments	133
III-4.2.	The potential number of H-bonds in amino acid residues	134
III-4.3.	Bifurcated hydrogen bonds	136
III-4.4.	Noncolinear hydrogen bonds	139
III-4.5.	Frustrated hydrogen bonds	140
III-4.6.	Low-barrier hydrogen bonds	140
III-5.	Examples of H/D exchange	142
III-5.1.	Introduction	142
III-5.2.	Rubredoxin	143
III-5.3.	Correlation of H/D exchange ratios with NMR results	144
III-5.4.	Unusual examples of H/D exchange	146
III-5.4.1.	Histidine	146
III-5.4.2.	Guanine	147
III-5.5.	Time evolution of H/D exchange	147
III-5.5.1.	RNase A	147
III-5.5.2.	T ₆ porcine insulin	150
III-6.	Protonation states of certain amino acid residues	152
III-6.1.	General view	152

III-6.2.	Protonation state of the N ^δ and N ^ε atoms of histidine: the case of insulin in heavy water	152
III-6.3.	Carboxylate groups of acidic residues	154
III-7.	Water molecules of hydration	155
III-7.1.	How a hydration molecule is observed experimentally	155
III-7.2.	Classification	155
III-7.3.	Dynamic behavior and/or disordered states of hydrations	157
III-7.4.	Oligomeric DNA duplexes	158
III-7.4.1.	The B-DNA decamer d(CCATTAAATGG) ₂	158
III-7.4.2.	The Z-DNA hexamer d(CGCGCG) ₂	159
III-7.5.	Water structure in concanavalin A (ConA)	161
III-8.	Detailed examples of NPC	163
III-8.1.	RNase A	163
III-8.1.1.	Structure of the active site	163
III-8.1.2.	Protonation states of His12 and His119	166
III-8.1.3.	H-bonding networks around His48 and Gln101	166
III-8.1.4.	Hydration structure	167
III-8.1.5.	Hydrogen bonds in α-helices and β-sheets	168
III-8.2.	Insulin	169
III-8.2.1.	The contribution of NPC to solving the classical problems in insulin	169
III-8.2.2.	The protonation/deprotonation of histidine	170
III-8.2.3.	Charge balance of the zinc positive charges	172
III-9.	Other examples of proteins solved by NPC	174
III-9.1.	Lysozyme	174
III-9.2.	Xylose isomerase	175
III-9.3.	Aldose reductase	176
III-9.4.	Cytochrome P450cam	176
III-9.5.	Amicyanin	177
III-9.6.	Dihydrofolate reductase (DHFR)	177
III-9.7.	Protocatechuate 3,4-dioxygenase (3,4-PCD)	178
III-9.8.	Human deoxyhemoglobin	178
III-9.9.	Diisopropyl fluorophosphatase	179
III-9.10.	Photoactive yellow protein	181
III-9.11.	Pancreatic elastase	181
III-9.12.	HIV-1 protease	184

III-9.13. D-antifreeze protein	186
III-9.14. Thermostable rubredoxin	186
III-10. Future prospects	187
III-10.1. Challenging structures (crystals with large unit cells)	187
III-10.2. “Next generation” spallation neutron sources	188
III-10.3. Pharmaceutical application (from a private communication by G. Klebe)	189
Appendix A: Neutron scattering length of elements	198
Appendix B: List of bio-macromolecules determined by NPC and deposited in the PDB before May 5, 2010	206
Appendix C: Typical examples of nuclear density maps of amino acid residues	211
Appendix D: The next-generation technique for detecting hydrogen atoms with NPC	220
Appendix E: Books on neutron diffraction and scattering—further reading	222
