UNIVERSITY PRESS

Contents

Preface	xv
1 Introduction	1
1.1 Thermal Physics	1
1.2 What are the Questions?	2
1.3 History	2
1.4 Basic Concepts and Assumptions	4
1.5 Road Map	5
Part I Entropy	
2 The Classical Ideal Gas	11
2.1 Ideal Gas	11
2.2 Phase Space of a Classical Gas	12
2.3 Distinguishability	12
2.4 Probability Theory	13
2.5 Boltzmann's Definition of the Entropy	13
2.6 $S = k \log W$	14
2.7 Independence of Positions and Momenta	14
2.8 Road Map for Part I	15
3 Discrete Probability Theory	16
3.1 What is Probability?	16
3.2 Discrete Random Variables and Probabilities	17
3.3 Probability Theory for Multiple Random Variables	18
3.4 Random Numbers and Functions of Random Variables	20
3.5 Mean, Variance, and Standard Deviation	22
3.6 Correlation Functions	23
3.7 Sets of Independent Random Numbers	24
3.8 Binomial Distribution	25
3.9 Gaussian Approximation to the Binomial Distribution	27
3.10 A Digression on Gaussian Integrals	28
3.11 Stirling's Approximation for $N!$	29
3.12 Binomial Distribution with Stirling's Approximation	32
3.13 Problems	33
4 The Classical Ideal Gas: Configurational Entropy	40
4.1 Separation of Entropy into Two Parts	40
4.2 Distribution of Particles between Two Subsystems	41
4.3 Consequences of the Binomial Distribution	42
4.4 Actual Number versus Average Number	43

4.5	The ‘Thermodynamic Limit’	44
4.6	Probability and Entropy	44
4.7	An Analytic Approximation for the Configurational Entropy	46
5	Continuous Random Numbers	47
5.1	Continuous Dice and Probability Densities	47
5.2	Probability Densities	48
5.3	Dirac Delta Functions	50
5.4	Transformations of Continuous Random Variables	53
5.5	Bayes’ Theorem	55
5.6	Problems	57
6	The Classical Ideal Gas: Energy-Dependence of Entropy	62
6.1	Distribution for the Energy between Two Subsystems	62
6.2	Evaluation of Ω_E	64
6.3	Probability Distribution for Large N	67
6.4	The Logarithm of the Probability Distribution and the Energy-Dependent Terms in the Entropy	69
7	Classical Gases: Ideal and Otherwise	71
7.1	Entropy of a Composite System of Classical Ideal Gases	71
7.2	Equilibrium Conditions for the Ideal Gas	72
7.3	The Volume-Dependence of the Entropy	74
7.4	Indistinguishable Particles	76
7.5	Entropy of a Composite System of Interacting Particles	78
7.6	The Second Law of Thermodynamics	83
7.7	Equilibrium between Subsystems	84
7.8	The Zeroth Law of Thermodynamics	85
7.9	Problems	86
8	Temperature, Pressure, Chemical Potential, and All That	88
8.1	Thermal Equilibrium	88
8.2	What do we Mean by ‘Temperature’?	89
8.3	Derivation of the Ideal Gas Law	90
8.4	Temperature Scales	93
8.5	The Pressure and the Entropy	94
8.6	The Temperature and the Entropy	95
8.7	The Entropy and the Chemical Potential	95
8.8	The Fundamental Relation and Equations of State	96
8.9	The Differential Form of the Fundamental Relation	97
8.10	Thermometers and Pressure Gauges	97
8.11	Reservoirs	97
8.12	Problems	98

Part II Thermodynamics

9 The Postulates and Laws of Thermodynamics	101
9.1 Thermal Physics	101
9.2 Microscopic and Macroscopic States	103
9.3 Macroscopic Equilibrium States	103
9.4 State Functions	104
9.5 Properties and Descriptions	104
9.6 Postulates of Thermodynamics	104
9.7 The Laws of Thermodynamics	107
10 Perturbations of Thermodynamic State Functions	109
10.1 Small Changes in State Functions	109
10.2 Conservation of Energy	110
10.3 Mathematical Digression on Exact and Inexact Differentials	110
10.4 Conservation of Energy Revisited	113
10.5 An Equation to Remember	114
10.6 Problems	115
11 Thermodynamic Processes	116
11.1 Irreversible, Reversible, and Quasi-Static Processes	116
11.2 Heat Engines	117
11.3 Maximum Efficiency	118
11.4 Refrigerators and Air Conditioners	119
11.5 Heat Pumps	120
11.6 The Carnot Cycle	121
11.7 Problems	121
12 Thermodynamic Potentials	123
12.1 Mathematical digression: the Legendre Transform	123
12.2 Helmholtz Free Energy	126
12.3 Enthalpy	128
12.4 Gibbs Free Energy	129
12.5 Other Thermodynamic Potentials	130
12.6 Massieu Functions	130
12.7 Summary of Legendre Transforms	130
12.8 Problems	131
13 The Consequences of Extensivity	133
13.1 The Euler Equation	133
13.2 The Gibbs–Duhem Relation	134
13.3 Reconstructing the Fundamental Relation	135
13.4 Thermodynamic Potentials	137
14 Thermodynamic Identities	138
14.1 Small Changes and Partial Derivatives	138
14.2 A Warning about Partial Derivatives	138

14.3	First and Second Derivatives	139
14.4	Standard Set of Second Derivatives	140
14.5	Maxwell Relations	141
14.6	Manipulating Partial Derivatives	143
14.7	Working with Jacobians	146
14.8	Examples of Identity Derivations	148
14.9	General Strategy	151
14.10	Problems	152
15	Extremum Principles	156
15.1	Energy Minimum Principle	156
15.2	Minimum Principle for the Helmholtz Free Energy	159
15.3	Minimum Principle for the Enthalpy	162
15.4	Minimum Principle for the Gibbs Free Energy	163
15.5	Exergy	164
15.6	Maximum Principle for Massieu Functions	165
15.7	Summary	165
15.8	Problems	165
16	Stability Conditions	167
16.1	Intrinsic Stability	167
16.2	Stability Criteria based on the Energy Minimum Principle	168
16.3	Stability Criteria based on the Helmholtz Free Energy Minimum Principle	170
16.4	Stability Criteria based on the Enthalpy Minimization Principle	171
16.5	Inequalities for Compressibilities and Specific Heats	172
16.6	Other Stability Criteria	173
16.7	Problems	175
17	Phase Transitions	177
17.1	The van der Waals Fluid	178
17.2	Derivation of the van der Waals Equation	178
17.3	Behavior of the van der Waals Fluid	179
17.4	Instabilities	180
17.5	The Liquid–Gas Phase Transition	182
17.6	Maxwell Construction	184
17.7	Coexistent Phases	184
17.8	Phase Diagram	185
17.9	Helmholtz Free Energy	186
17.10	Latent Heat	188
17.11	The Clausius–Clapeyron Equation	188
17.12	Gibbs’ Phase Rule	190
17.13	Problems	191

18 The Nernst Postulate: the Third Law of Thermodynamics	194
18.1 Classical Ideal Gas Violates the Nernst Postulate	194
18.2 Planck's Form of the Nernst Postulate	195
18.3 Consequences of the Nernst Postulate	195
18.4 Coefficient of Thermal Expansion at Low Temperatures	196
18.5 Summary and Signposts	197
 Part III Classical Statistical Mechanics	
19 Ensembles in Classical Statistical Mechanics	201
19.1 Microcanonical Ensemble	202
19.2 Molecular Dynamics: Computer Simulations	202
19.3 Canonical Ensemble	204
19.4 The Partition Function as an Integral over Phase Space	207
19.5 The Liouville Theorem	207
19.6 Consequences of the Canonical Distribution	209
19.7 The Helmholtz Free Energy	210
19.8 Thermodynamic Identities	211
19.9 Beyond Thermodynamic Identities	212
19.10 Integration over the Momenta	213
19.11 Monte Carlo Computer Simulations	214
19.12 Factorization of the Partition Function: the Best Trick in Statistical Mechanics	217
19.13 Simple Harmonic Oscillator	218
19.14 Problems	220
20 Classical Ensembles: Grand and Otherwise	227
20.1 Grand Canonical Ensemble	227
20.2 Grand Canonical Probability Distribution	228
20.3 Importance of the Grand Canonical Partition Function	230
20.4 $\mathcal{Z}(T, V, \mu)$ for the Ideal Gas	231
20.5 Summary of the Most Important Ensembles	231
20.6 Other Classical Ensembles	232
20.7 Problems	232
21 Irreversibility	234
21.1 What Needs to be Explained?	234
21.2 Trivial Form of Irreversibility	235
21.3 Boltzmann's H-Theorem	235
21.4 Loschmidt's <i>Umkehrreinwand</i>	235
21.5 Zermelo's <i>Wiederkehrreinwand</i>	236
21.6 Free Expansion of a Classical Ideal Gas	236
21.7 Zermelo's <i>Wiederkehrreinwand</i> Revisited	240
21.8 Loschmidt's <i>Umkehrreinwand</i> Revisited	241
21.9 What is 'Equilibrium'?	242
21.10 Entropy	242
21.11 Interacting Particles	243

Part IV Quantum Statistical Mechanics

22 Quantum Ensembles	247
22.1 Basic Quantum Mechanics	248
22.2 Energy Eigenstates	248
22.3 Many-Body Systems	251
22.4 Two Types of Probability	252
22.5 The Density Matrix	254
22.6 The Uniqueness of the Ensemble	255
22.7 The Quantum Microcanonical Ensemble	256
23 Quantum Canonical Ensemble	258
23.1 Derivation of the QM Canonical Ensemble	258
23.2 Thermal Averages and the Average Energy	260
23.3 The Quantum Mechanical Partition Function	260
23.4 The Quantum Mechanical Entropy	262
23.5 The Origin of the Third Law of Thermodynamics	264
23.6 Derivatives of Thermal Averages	266
23.7 Factorization of the Partition Function	266
23.8 Special Systems	269
23.9 Two-Level Systems	269
23.10 Simple Harmonic Oscillator	271
23.11 Einstein Model of a Crystal	273
23.12 Problems	275
24 Black-Body Radiation	282
24.1 Black Bodies	282
24.2 Universal Frequency Spectrum	282
24.3 A Simple Model	283
24.4 Two Types of Quantization	283
24.5 Black-Body Energy Spectrum	285
24.6 Total Energy	288
24.7 Total Black-Body Radiation	289
24.8 Significance of Black-Body Radiation	289
24.9 Problems	289
25 The Harmonic Solid	291
25.1 Model of an Harmonic Solid	291
25.2 Normal Modes	292
25.3 Transformation of the Energy	296
25.4 The Frequency Spectrum	298
25.5 The Energy in the Classical Model	299
25.6 The Quantum Harmonic Crystal	300
25.7 Debye Approximation	301
25.8 Problems	306

26 Ideal Quantum Gases	308
26.1 Single-Particle Quantum States	308
26.2 Density of Single-Particle States	310
26.3 Many-Particle Quantum States	311
26.4 Quantum Canonical Ensemble	312
26.5 Grand Canonical Ensemble	312
26.6 A New Notation for Energy Levels	313
26.7 Exchanging Sums and Products	315
26.8 Grand Canonical Partition Function for Independent Particles	315
26.9 Distinguishable Quantum Particles	316
26.10 Sneaky Derivation of $PV = Nk_B T$	317
26.11 Equations for $U = \langle E \rangle$ and $\langle N \rangle$	318
26.12 $\langle n_\epsilon \rangle$ for bosons	319
26.13 $\langle n_\epsilon \rangle$ for fermions	319
26.14 Summary of Equations for Fermions and Bosons	320
26.15 Integral Form of Equations for N and U	321
26.16 Basic Strategy for Fermions and Bosons	322
26.17 $P = 2U/3V$	322
26.18 Problems	324
27 Bose–Einstein Statistics	326
27.1 Basic Equations for Bosons	326
27.2 $\langle n_\epsilon \rangle$ for Bosons	326
27.3 The Ideal Bose Gas	327
27.4 Low-Temperature Behavior of μ	328
27.5 Bose–Einstein Condensation	329
27.6 Below the Einstein Temperature	330
27.7 Energy of an Ideal Gas of Bosons	331
27.8 What About the Second-Lowest Energy State?	332
27.9 The Pressure below $T < T_E$	333
27.10 Transition Line in P - V Plot	334
27.11 Problems	334
28 Fermi–Dirac Statistics	336
28.1 Basic Equations for Fermions	336
28.2 The Fermi Function and the Fermi Energy	337
28.3 A Useful Identity	338
28.4 Systems with a Discrete Energy Spectrum	339
28.5 Systems with Continuous Energy Spectra	340
28.6 Ideal Fermi Gas	340
28.7 Fermi Energy	340
28.8 Compressibility of Metals	341
28.9 Sommerfeld Expansion	342
28.10 General Fermi Gas at Low Temperatures	345

28.11	Ideal Fermi Gas at Low Temperatures	346
28.12	Problems	348
29	Insulators and Semiconductors	351
29.1	Tight-Binding Approximation	351
29.2	Bloch's Theorem	353
29.3	Nearly-Free Electrons	354
29.4	Energy Bands and Energy Gaps	357
29.5	Where is the Fermi Energy?	358
29.6	Fermi Energy in a Band (Metals)	358
29.7	Fermi Energy in a Gap	359
29.8	Intrinsic Semiconductors	362
29.9	Extrinsic Semiconductors	362
29.10	Semiconductor Statistics	364
29.11	Semiconductor Physics	367
30	Phase Transitions and the Ising Model	368
30.1	The Ising Chain	369
30.2	The Ising Chain in a Magnetic Field ($J = 0$)	369
30.3	The Ising Chain with $h = 0$, but $J \neq 0$	371
30.4	The Ising Chain with both $J \neq 0$ and $h \neq 0$	372
30.5	Mean Field Approximation	376
30.6	Critical Exponents	380
30.7	Mean-Field Exponents	381
30.8	Analogy with the van der Waals Approximation	382
30.9	Landau Theory	383
30.10	Beyond Landau Theory	384
30.11	Problems	385
	Appendix: Computer Calculations and VPython	390
A.1	Histograms	390
A.2	The First VPython Program	391
A.3	VPython Functions	393
A.4	Graphs	393
A.5	Reporting VPython Results	395
A.6	Timing Your Program	397
A.7	Molecular Dynamics	397
A.8	Courage	398
	Index	399
