The Physics of Nanoelectronics

Transport and Fluctuation Phenomena at Low Temperatures

Tero T. Heikkilä

Low Temperature Laboratory, Aalto University, Finland

Contents

List of symbols	xviii
1 Introduction	1
1.1 Studied systems	3
1.1.1 Metallic wires and metal-to-metal contacts	4
1.1.2 Semiconductor systems	6
1.1.3 Carbon nanotubes and molecules	7
1.1.4 Graphene	8
1.2 Classical vs. quantum transport	9
1.2.1 Drude formula	10
1.2.2 Quantum effects	10
Further reading	13
Exercises	14
2 Semiclassical theory	15
2.1 Semiclassical Boltzmann equation	17
2.2 Observables	19
2.3 Relaxation time approximation	19
2.4 Elastic scattering and diffusive limit	20
2.4.1 Currents in the diffusive limit	22
2.5 Inelastic scattering	23
2.5.1 Electron–electron scattering	24
2.5.2 Electron–phonon scattering	27
2.6 Junctions	28
2.7 Magnetic heterostructures	30
2.8 Thermoelectric effects	34
Further reading	35
Exercises	36
3 Scattering approach to quantum transport	37
3.1 Scattering region, leads and reservoirs	38
3.1.1 Transverse modes in semi-infinite leads	38
3.1.2 Current carried by a transverse mode	40
3.1.3 Wire between two reservoirs	41
3.1.4 Quantum point contacts	42
3.2 Scattering matrix	44
3.2.1 Some properties of the scattering matrix	45
3.2.2 Combining scattering matrices: Feynman paths	47
3.3 Conductance from scattering	48

3.3.1	Diffusive wire and Drude formula	51
3.4	Resonant tunnelling	53
3.5	Models for inelastic scattering and dephasing	54
3.6	Further developments	55
3.6.1	Time-dependent transport	55
3.6.2	Non-linear transport	56
3.6.3	Application to magnetic systems	56
	Further reading	58
	Exercises	58
4	Quantum interference effects	60
4.1	Aharonov–Bohm effect	61
4.2	Localization	62
4.2.1	Weak localization	64
4.2.2	Localization length	65
4.2.3	Weak localization from enhanced backscattering	65
4.2.4	Dephasing	67
4.2.5	Magnetic field effect on weak localization	68
4.3	Universal conductance fluctuations	70
4.3.1	Effect of dephasing	72
4.4	Persistent currents	72
	Further reading	76
	Exercises	76
5	Introduction to superconductivity	78
5.1	Cooper pairing	78
5.2	Main physical properties	79
5.2.1	Current without dissipation	79
5.2.2	Meissner effect	80
5.2.3	BCS theory briefly	80
5.2.4	Energy gap and BCS divergence	83
5.2.5	Coherence length	83
5.3	Josephson effect	84
5.4	Main phenomena characteristic for mesoscopic systems	86
5.4.1	Andreev reflection	86
5.4.2	Andreev bound states	88
5.4.3	Proximity effect	91
	Further reading	92
	Exercises	92
6	Fluctuations and correlations	94
6.1	Definition and main characteristics of noise	94
6.1.1	Motivations for the study of noise	96
6.1.2	Fluctuation–dissipation theorem	96
6.1.3	Thermal and vacuum fluctuations	97
6.1.4	Shot noise	97
6.2	Scattering approach to noise	98
6.2.1	Two-terminal noise	99

6.3	Langevin approach to noise in electric circuits	102
6.4	Boltzmann–Langevin approach	104
6.5	Cross-correlations	105
6.5.1	Equilibrium correlations	106
6.5.2	Finite-voltage cross-correlations	106
6.6	Effect of noise on quantum dynamics	108
6.6.1	Relaxation	109
6.6.2	Dephasing	110
6.7	Full counting statistics	114
6.7.1	Basic statistics	114
6.7.2	Full counting statistics of charge transfer	115
6.8	Heat current noise	117
	Further reading	118
	Exercises	118
7	Single-electron effects	121
7.1	Charging energy	121
7.1.1	Single-electron box	123
7.1.2	Single-electron transistor (SET)	124
7.2	Tunnel Hamiltonian and tunnelling rates	124
7.3	Master equation	127
7.4	Cotunnelling	129
7.5	Dynamical Coulomb blockade	131
7.5.1	Phase fluctuations	133
7.6	Single-electron devices	135
7.6.1	Coulomb blockade thermometer	135
7.6.2	Radio frequency SET	136
7.6.3	Single-electron pump	137
	Further reading	138
	Exercises	139
8	Quantum dots	140
8.1	Electronic states in quantum dots	141
8.1.1	Spectral function	142
8.2	Weakly interacting limit	144
8.3	Weakly transmitting limit: Coulomb blockade	146
8.3.1	Metallic limit	149
8.3.2	Two-state limit	149
8.3.3	Addition spectrum	150
8.3.4	Charge sensing with quantum point contacts	151
8.4	Kondo effect	151
8.5	Double quantum dots	153
8.5.1	Artificial molecules	154
8.5.2	Spin states in double quantum dots	154
8.5.3	Pauli spin blockade	155
8.5.4	Spin qubits in quantum dots	156
	Further reading	157
	Exercises	157

9	Tunnel junctions with superconductors	159
9.1	Tunnel contacts without Josephson coupling	159
9.1.1	NIS contact	159
9.1.2	SIS contact	160
9.1.3	Superconducting SET	160
9.2	SINIS heat transport and pumping	162
9.2.1	Thermometry with (SI)NIS junctions	163
9.2.2	Electron cooling and refrigeration	163
9.3	Josephson junctions	167
9.3.1	SQUIDs	167
9.3.2	Resistively and capacitively shunted junction model	169
9.3.3	Overdamped regime	170
9.3.4	Underdamped regime	170
9.3.5	Escape process	170
9.4	Quantum effects in small Josephson junctions	172
9.4.1	‘Tight-binding limit’	173
9.4.2	‘Nearly free-electron limit’	174
9.4.3	Superconducting qubits	177
	Further reading	181
	Exercises	181
10	Graphene	183
10.1	Electron dispersion relation in monolayer graphene	184
10.1.1	Massless Dirac fermions in graphene	184
10.1.2	Eigensolutions in monolayer graphene	186
10.2	Bilayer and more	187
10.2.1	Multilayer graphene	189
10.3	Ray optics with electrons: np and npn junctions	193
10.3.1	Graphene np junction	193
10.3.2	Klein tunnelling	194
10.4	Pseudodiffusion	196
10.5	Graphene nanoribbons	198
10.5.1	Zigzag ribbons	198
10.5.2	Armchair ribbons	200
	Further reading	201
	Exercises	201
11	Nanoelectromechanical systems	203
11.1	Nanomechanical systems	205
11.1.1	Basic elastic theory	205
11.1.2	Flexural eigenmodes of a doubly clamped beam without tension	206
11.1.3	Effect of tension on the vibration modes	208
11.1.4	Driving and dissipation	209
11.2	Coupling to nanoelectronics	211
11.2.1	Magnetomotive actuation and detection	211
11.2.2	Capacitive actuation and detection	212

11.2.3	SQUID detection	214
11.2.4	Detection through single-electron effects	215
11.3	Coupling to microwave resonant circuits	216
11.4	Quantum effects	222
11.4.1	Creating a quantum superposition of vibration states in an oscillator–qubit system	223
11.4.2	Describing dissipation	226
Further reading		227
Exercises		228
A	Important technical tools	229
A.1	Second quantization: a short introduction	229
A.1.1	Bosons	229
A.1.2	Fermions	231
A.2	Heisenberg and Schrödinger pictures	232
A.2.1	Interaction picture	233
A.3	Fermi golden rule	234
A.3.1	Higher order: generalized Fermi golden rule	235
A.4	Describing magnetic field in quantum mechanics	237
A.5	Chemical potential and Fermi energy	237
A.6	Pauli spin matrices	240
A.7	Useful integrals	241
Exercises		241
B	Current operator for the scattering theory	243
C	Fluctuation–dissipation theorem	245
C.1	Linear response theory and susceptibility	245
C.2	Derivation of the fluctuation–dissipation theorem	247
D	Derivation of the Boltzmann–Langevin noise formula	249
E	Reflection coefficient in electronic circuits	253
