Machine Learning in Medicine - Cookbook

Contents

Part I Cluster Models

1	Hierarchical Clustering and K-means Clustering to Identify Subgroups in Surveys (50 Patients)	3
	General Purpose.	3
	Specific Scientific Question	3
	Hierarchical Cluster Analysis	4
	K-means Cluster Analysis.	6
	Conclusion	7
	Note.	8
2	Density-Based Clustering to Identify Outlier Groups in Otherwise Homogeneous Data (50 Patients)	9
	General Purpose.	9
	Specific Scientific Question	9
	Density-Based Cluster Analysis.	10
	Conclusion	11
	Note.	11
3	Two Step Clustering to Identify Subgroups and Predict Subgroup Memberships in Individual Future Patients (120 Patients)	13
	General Purpose.	13
	Specific Scientific Question	13
	The Computer Teaches Itself to Make Predictions	14
	Conclusion	15
	Note.	15

Part II Linear Models

4	Linear, Logistic, and Cox Regression for Outcome Prediction with Unpaired Data (20, 55, and 60 Patients)	19
	General Purpose.	19

	Specific Scientific Question	19
	Linear Regression, the Computer Teaches Itself to Make Predictions	19
	Conclusion	21
	Note	21
	Logistic Regression, the Computer Teaches Itself to Make Predictions	22
	Conclusion	24
	Note	24
	Cox Regression, the Computer Teaches Itself to Make Predictions	24
	Conclusion	26
	Note	26
5	Generalized Linear Models for Outcome Prediction with Paired Data (100 Patients and 139 Physicians)	29
	General Purpose.	29
	Specific Scientific Question	29
	Generalized Linear Modeling, the Computer Teaches Itself to Make Predictions	29
	Conclusion	31
	Generalized Estimation Equations, the Computer Teaches Itself to Make Predictions	32
	Conclusion	34
	Note	35
6	Generalized Linear Models for Predicting Event-Rates (50 Patients)	37
	General Purpose.	37
	Specific Scientific Question	37
	The Computer Teaches Itself to Make Predictions	38
	Conclusion	40
	Note	41
7	Factor Analysis and Partial Least Squares for Complex-Data Reduction (250 Patients)	43
	General Purpose.	43
	Specific Scientific Question	43
	Factor Analysis	44
	Partial Least Squares Analysis.	46
	Traditional Linear Regression	48
	Conclusion	48
	Note	49

8	Optimal Scaling of High-Sensitivity Analysis of Health Predictors (250 Patients)	51
	General Purpose	51
	Specific Scientific Question	51
	Traditional Multiple Linear Regression	52
	Optimal Scaling Without Regularization	53
	Optimal Scaling with Ridge Regression	54
	Optimal Scaling with Lasso Regression	54
	Optimal Scaling with Elastic Net Regression	55
	Conclusion	56
	Note	56
9	Discriminant Analysis for Making a Diagnosis from Multiple Outcomes (45 Patients)	57
	General Purpose	57
	Specific Scientific Question	57
	The Computer Teaches Itself to Make Predictions	58
	Conclusion	61
	Note	61
10	Weighted Least Squares for Adjusting Efficacy Data with Inconsistent Spread (78 Patients)	63
	General Purpose	63
	Specific Scientific Question	63
	Weighted Least Squares	64
	Conclusion	66
	Note	66
11	Partial Correlations for Removing Interaction Effects from Efficacy Data (64 Patients)	67
	General Purpose	67
	Specific Scientific Question	67
	Partial Correlations	68
	Conclusion	70
	Note	71
12	Canonical Regression for Overall Statistics of Multivariate Data (250 Patients)	73
	General Purpose	73
	Specific Scientific Question	73
	Canonical Regression	74
	Conclusion	76
	Note	77

Part III Rules Models

13 Neural Networks for Assessing Relationships that are Typically Nonlinear (90 Patients)	81
General Purpose.	81
Specific Scientific Question	81
The Computer Teaches Itself to Make Predictions	82
Conclusion	83
Note.	83
14 Complex Samples Methodologies for Unbiased Sampling (9,678 Persons)	85
General Purpose.	85
Specific Scientific Question	85
The Computer Teaches Itself to Predict Current Health Scores from Previous Health Scores	87
The Computer Teaches Itself to Predict Odds Ratios of Current Health Scores Versus Previous Health Scores	88
Conclusion	90
Note.	90
15 Correspondence Analysis for Identifying the Best of Multiple Treatments in Multiple Groups (217 Patients)	91
General Purpose.	91
Specific Scientific Question	91
Correspondence Analysis	92
Conclusion	95
Note.	95
16 Decision Trees for Decision Analysis (1,004 and 953 Patients)	97
General Purpose.	97
Specific Scientific Question	97
Decision Trees with a Binary Outcome	97
Decision Trees with a Continuous Outcome	101
Conclusion	104
Note.	104
17 Multidimensional Scaling for Visualizing Experienced Drug Efficacies (14 Pain-Killers and 42 Patients)	105
General Purpose.	105
Specific Scientific Question	105
Proximity Scaling	105
Preference Scaling	108
Conclusion	112
Note.	113

18	Stochastic Processes for Long Term Predictions from Short Term Observations	115
	General Purpose	115
	Specific Scientific Questions	115
	Conclusion	120
	Note	121
19	Optimal Binning for Finding High Risk Cut-offs (1,445 Families)	123
	General Purpose	123
	Specific Scientific Question	123
	Optimal Binning	124
	Conclusion	127
	Note	127
20	Conjoint Analysis for Determining the Most Appreciated Properties of Medicines to be Developed (15 Physicians)	129
	General Purpose	129
	Specific Scientific Question	129
	Constructing an Analysis Plan	129
	Performing the Final Analysis	131
	Conclusion	134
	Note	134
	Index	135
