ABSTRACT: We review the general heat kernel method for the Dirac spinor field as an elementary example in any arbitrary background. We, then compute the first three Seeley-DeWitt coefficients for the massless free spin-3/2 Rarita-Schwinger field.
1 Introduction

Heat kernel is the fundamental solution to the heat equation for an elliptic partial differential operator on a specified domain with proper boundary conditions. It turns out that the heat kernel is one of the most important tools in spectral geometry, in differential geometry, and in global analysis more generally [1]. Moreover, asymptotics of the heat kernel are related to the eigenvalue asymptotics [2]. It is also a useful tool to study the index theorem of Atiyah and Singer [3, 4].

Another motivation to study the heat kernel comes from physics. The important works by Fock [5] and Schwinger [6] introduced the heat kernel to quantum theory. Again, DeWitt’s covariant approach [7–10] made heat kernel one of the powerful tools for quantum field theory and quantum gravity (also review [11–13]). The heat kernel expansion is a very convenient tool for studying one-loop divergences, anomalies, and various asymptotics of the effective action. In recent years, the progress in theoretical physics, especially in string theory and related areas made special use of heat kernel coefficients to calculate the logarithmic corrections to Bekenstein-Hawking black hole entropy [14–19]. These logarithmic corrections have great significance as they are aspects of the high energy theory, but one may compute them systematically in the low energy effective theory; which involves
computation of heat kernel coefficient (more precisely coefficient $a_4$ introduced in eq. (2.9)) for the kinetic differential operator of the massless fields in the black hole background.

In recent years, Rarita–Schwinger field has become one of the active research topics in theoretical physics. Although, Rarita–Schwinger field plays dominating role in supergravity, it has many other important applications. Analysis for massless Rarita–Schwinger field in covariant and the Coulomb-like gauges can be useful for perturbative interacting field theories [20]. Also, recent investigations [21–23] suggest that spin-3/2 may have a crucial role to play in explaining the evolution of the universe. It turns out that a detailed investigation of the heat kernel for the spin-3/2 Rarita–Schwinger field is useful for many research applications. So, in this paper, our main aim will be to present a general approach for calculating heat kernel coefficients for massless free spin-3/2 Rarita-Schwinger field. We start with reviewing the general heat kernel technique for some elementary examples of Dirac spinor field around an arbitrary background field configuration.

To illustrate the use of heat kernel in quantum field theory, let us consider the Gaussian form of the Euclidean path integral in one-loop approximation

$$e^{-W} = \int [\mathcal{D}\phi] e^{-\phi \Lambda \phi} = \frac{1}{\sqrt{\det \Lambda}},$$

where $\Lambda$ is a kinetic differential operator of background fields $\{\phi\}$ (schematic form is shown in eq. (2.3)) and $W$ is the corresponding one-loop effective action. Also, one can express the one loop determinant $\det \Lambda$ as a product over the spectrum of $\Lambda$,

$$\det \Lambda = \prod_i \lambda_i,$$

$$W = \frac{1}{2} \ln \det \Lambda = \frac{1}{2} \sum_i \ln \lambda_i. \quad (1.3)$$

We regularize the sum over eigenvalues($\lambda_i's$) using the heat kernel method. With the eigenfunctions of $\Lambda$ are given, one can modify the Green’s function$^2$ as

$$K(x, x'; s) = \sum_i e^{-s\lambda_i} f_i(x) f_i^*(x'),$$

which satisfies the heat equation

$$(\partial_s + \Lambda_x)K(x, x'; s) = 0; \quad (1.5)$$

hence the reference to heat. The heat kernel parameter $s$ has units of length squared. One can avoid the dependence on the eigenfunctions by setting $x = x'$, integrating over the manifold of interest, and using the normalization of the eigenfunctions $f_i(x)$. The resulting function $D(s)$ will be referred as the heat kernel,

$$D(s) = \int d^4x \sqrt{\det g_{\mu\nu}} K(x, x; s) = \text{tr} e^{-s\Lambda} = \sum_i e^{-s\lambda_i}. \quad (1.6)$$

---

$^1$One loop approximation involves the expansion of the Lagrangian $\mathcal{L}(\Phi)$ of the system up to quadratic order in fluctuations ($\phi$) around some classical background.

$^2$The Green’s function is subject to the boundary condition $K(x, x'; s = 0) = \delta(x - x')$, a consequence of the orthonormality of the eigenfunctions $f_i(x)$.
\(D(s)\) is an object of interest for us because the one loop determinant \((1.3)\) is then expressed as
\[
W = -\frac{1}{2} \int_{\epsilon}^{\infty} ds \frac{D(s)}{s},
\]
where \(\epsilon\) is a UV regulator with the dimension of length, added by hand since the integral \((1.7)\) diverges at small \(s\). \(W\) is important to our work as it is the input to Sen’s quantum entropy function. Given the spectrum \(\lambda_i\) of the kinetic operator \(\Lambda\), one can evaluate the heat kernel using eq. \((1.6)\). Once we get \(D(s)\) in our hand, we can calculate the one loop effective action \(W\) and thus one loop corrections to black hole entropy, given the knowledge of the spectrum of fields present around the black hole geometry.

The rest of this paper is organized as follows. In § 2, we first review the general heat kernel method \cite{13} for determining heat kernel coefficients for field fluctuations around any arbitrary background, and also list out general formulae for first three Seeley-DeWitt coefficients. Next, we employ this method to the different cases of Dirac spinor field as a warm up exercise. We consider the cases of free and gauged Dirac spinor fields for both massless and massive cases. Then, in § 3 we compute Seeley-DeWitt coefficients for the spin-3/2 Rarita-Schwinger field following the same general approach. In § 4, we end by summarizing the results. In Appendix A, we mention some basic identities of Riemann tensor used in our work. Finally, in Appendices B and C, we compute some antisymmetrized gamma product and Riemann-gamma products which were used in the analysis in §§ 2.2 and 3.

## 2 General heat kernel method

Let us start with a four-dimensional theory of gravity with an action having the form,
\[
S = \int d^4x \sqrt{\det g_{\mu\nu}} \mathcal{L},
\]
where \(g_{\mu\nu}\) is the background metric\(^3\) and \(\mathcal{L}\) is the Lagrangian density. Considering up to quadratic order in fluctuations around a particular background, the action takes the schematic form,
\[
S = \int d^4x \sqrt{\det g_{\mu\nu}} M^{mp} \phi_p \Lambda^m_n \phi_n,
\]
where \(M\) is some matrix, \(\{\phi_m\}\) is the set of all the fluctuating fields, \(\Lambda\) is the kinetic differential operator acting on quadratic field fluctuations.

The present method demands \(\Lambda\) to be both Hermitian and Laplace-type. To make \(\Lambda\) as Hermitian, we must restructure our action (up to a total derivative) while for the later requirement, we choose \(\Lambda\) to have the following Laplace-type form
\[
\Lambda^m_n = -(D^\mu D_\mu) T^m_n - (N^\mu D_\mu)_m^n - P^n_m,
\]
\(^3\)The Euclidean signature of the metric is assumed in this paper; in our convention sig\((g_{\mu\nu}) = (+++).\)
where $D_\mu$ is the ordinary covariant derivative with connections determined by the background metric; $N$ and $P$ are arbitrary matrices constructed from the background fields; and $I$ is the corresponding identity operator on the space of fields.

Using the definition $D_\mu = D_\mu + \omega_\mu$ in eq. (2.3) we can rewrite $\Lambda$ as

$$\Lambda_m^n = -(D^\mu D_\mu)^m_n - \{(P^m_n - (\omega^\mu \omega_m)_m^m - (D^\mu \omega_\mu)_m^n\} - \{(N^m - 2\omega^\mu)D_\mu\}_m^n. \quad (2.4)$$

Finally, one can compare eq. (2.4) with the standard form

$$\Lambda = -(D^\mu D_\mu)I - E, \quad (2.5)$$

and identify the following useful matrices,

$$\omega_\mu = \frac{1}{2}N_\mu,$$

$$E = P - (\omega^\mu \omega_\mu) - (D^\mu \omega_\mu). \quad (2.6)$$

Note that the term in parentheses $(D^\mu \omega_\mu)$ indicates the covariant derivative $D^\mu$ acting only on $\omega_\mu$.

The curvature associated with $D_\mu$ is defined as

$$\Omega_{\mu\nu} \equiv [D_\mu, D_\nu] = [D_\mu, D_\nu] + D_{[\mu} \omega_{\nu]} + [\omega_\mu, \omega_\nu], \quad (2.7)$$

2.1 General formulae

The heat kernel corresponding to the differential operator $\Lambda$ is defined in eq. (1.6), and for small $s$ its perturbative expansion has the following form [7–10, 13, 24–32]

$$D(s) \equiv \int d^4x \sqrt{\det g_{\mu\nu}} \sum_{n=0}^{\infty} s^{n-2}a_{2n}(x)$$

$$= \int d^4x \sqrt{\det g_{\mu\nu}} \left\{ \frac{1}{s^2}a_0(x) + \frac{1}{s}a_2(x) + a_4(x) + \cdots \right\}, \quad (2.8)$$

where the coefficients $a_{2n}(x)$ are known as Seeley-DeWitt coefficients\(^4\) [7–10, 24, 25]. We want to express these coefficients in terms of local invariants obtained from background metric $(g_{\mu\nu})$, Riemann tensor $(R_{\mu\nu\rho\sigma})$, Ricci tensor $(R_{\mu\nu})$, Ricci scalar $(R)$, gauge field strength $(F_{\mu\nu})$ and their covariant derivatives. Once computed we can employ this general result for any arbitrary background field configuration.

\(^4\)In eq. (2.8), the terms $\int d^4x \sqrt{\det g_{\mu\nu}} a_{2n}(x)$ are our desired heat kernel coefficients and to obtain these coefficients, we must choose a particular manifold to perform the integration. But our aim is to calculate generalized form heat kernel coefficients for spin-3/2 Rarita-Schwinger field. So, we focus on computation of Seeley-DeWitt coefficients instead.
With the definitions discussed in this section, the results for the leading Seeley-DeWitt coefficients (see eqs. 4.26, 4.27 and 4.28 of [13]) are summarized in the following equations\(^5\).

\[
\begin{align*}
(4\pi)^2 a_0(x) &= \text{tr}(I), \\
(4\pi)^2 a_2(x) &= \frac{1}{6}\text{tr}(6E + RI), \\
(4\pi)^2 a_4(x) &= \frac{1}{360}\text{tr}\left\{ 60RE + 180E^2 + 30\Omega_{\mu\nu}\Omega^{\mu\nu} + (5R^2 + 2R_{\mu\nu\rho\sigma}R^{\mu\nu\rho\sigma} - 2R_{\mu\nu}R^{\mu\nu}) I \right\}.
\end{align*}
\]

We note that all the total derivative terms are neglected as they will serve as boundary terms in the integral eq. (2.8) and hence will vanish after integration. Here, “tr” denotes trace over the field index \(m\). One can evaluate curvature tensors and curvature scalar from the background metric \((g_{\mu\nu})\) and the results for \(E, I\) and \(\Omega\) can be obtained from eqs. (2.6) and (2.7). In principle, we can compute higher order Seeley-DeWitt coefficients, \(a_6(x), a_8(x), \ldots\) as per requirements in this method.

### 2.2 Elementary examples

In this section, we start with illustrating the general heat kernel approach to calculate the heat kernel coefficients for Dirac spinor field as an elementary example. We calculate first three Seeley-DeWitt coefficients for four different cases namely massless free Dirac spinor field, massive free Dirac spinor field, massless gauged Dirac spinor field, and massive gauged Dirac spinor field.

#### 2.2.1 Free Dirac spinor field

The classical Lagrangian for a massless free Dirac spinor \(\psi_a\)\(^6\) is given by

\[
\mathcal{L} = i\bar{\psi}_a (\gamma^\mu)^{ab}(D_\mu \psi_b),
\]

where \(D_\mu\) is the covariant derivative acting on the spinors and the gamma matrices \((\gamma^\mu)\) satisfy the standard 4D Clifford algebra,

\[
\gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\mu = 2g^{\mu\nu}I_4.
\]

with \(I_4\) being the identity matrix in Clifford algebra. We can express the Lagrangian as

\[
\mathcal{L} = \bar{\psi}_a \slashed{D} \psi_b,
\]

where \(\slashed{D} = i\gamma^\mu D_\mu\) is the first-order Dirac-type differential operator. Assuming our space-time to be even-dimensional having Euclidean signature, our gamma matrices are Hermitian, \(\gamma^\dagger_\mu = \gamma_\mu\) and hence the operator \(\gamma^\mu D_\mu\) is anti-Hermitian, \((\gamma^\mu D_\mu)^\dagger = -\gamma^\mu D_\mu\). With this choice, the differential operator \(\slashed{D}\) is Hermitian.

---

\(^5\)The formulae given in eq. (2.9) are only valid for manifolds without boundary.

\(^6\)In this paper, Roman alphabet represents spinor index and Greek alphabet represents space-time index. Both types of indices varies from 0 to 3 in our four-dimensional space-time. In some steps, we will skip spin indices for notational simplicity. Also, for raising and lowering of spin indices and space-time indices we will use Kronecker delta \(\delta^{ab}\) and background metric \(g_{\mu\nu}\) respectively.
We then compute the relevant second-order Laplace-type differential operator\(^7\) acting on \(\psi\),

\[
\Lambda = \mathcal{D}^2 = i^2 \gamma^\mu \gamma^\nu D_\mu D_\nu \\
= - (D^\mu D_\mu) - \frac{1}{2} \gamma^\mu \gamma^\nu [D_\mu, D_\nu].
\] (2.13)

Note that we have used the gamma identity (2.11) to simplify eq.(2.13). Again using gamma matrix commutation relation, we have

\[
[D_\mu, D_\nu] \psi_b = \frac{1}{4} (\gamma^\theta \gamma^\phi)_{bc} R_{\mu\nu\theta\phi} \psi_c.
\] (2.14)

By using eq.(2.14) as well as identity given in eq. (C.16) in eq.(2.13) we find that

\[
\bar{\psi}_a \Lambda^{ab} \psi_b = - \delta^{ab} \bar{\psi}_a (D^\mu D_\mu) \psi_b - \frac{1}{2} \bar{\psi}_a (\gamma^\mu \gamma^\nu)^{ab} [D_\mu, D_\nu] \psi_b \\
= - \delta^{ab} \bar{\psi}_a (D^\mu D_\mu) \psi_b - \frac{1}{8} \bar{\psi}_a (\gamma^\mu \gamma^\nu \gamma^\theta \gamma^\phi)^{ab} R_{\mu\nu\theta\phi} \psi_b.
\] (2.15)

Now using the definition

\[
D_\mu \psi_a = D_\mu \psi_a + (\omega_\mu)_a^b \psi_b,
\] (2.16)

we can rewrite eq.(2.15) as

\[
\bar{\psi}_a \Lambda^{ab} \psi_b = - \delta^{ab} \bar{\psi}_a (D^\mu D_\mu) \psi_b + \bar{\psi}_a \left\{ D^\mu (\omega_\mu)^{ab} + (\omega_\mu)^{ac} (\omega^b)_c + \frac{R}{4} \delta^{ab} \right\} \psi_b \\
+ 2 \bar{\psi}_a (\omega_\mu)_a^b (D_\mu \psi_b).
\] (2.17)

The final form of the relevant Laplace-type operator \(\Lambda\) becomes

\[
\Lambda = - \delta^{ab} (D^\mu D_\mu) + \left\{ D^\mu (\omega_\mu)^{ab} + (\omega_\mu)^{ac} (\omega^b)_c + \frac{R}{4} \delta^{ab} \right\} + 2 (\omega_\mu)^{ab} D_\mu.
\] (2.18)

One can compare eq. (2.18) with eq. (2.5) and easily extract following useful matrices using eq. (2.6)

\[
I^{ab} = \delta^{ab}, \quad \omega_\mu = 0, \\
E^{ab} = - \frac{R}{4} \delta^{ab}, \\
(\Omega_{\mu\nu})^{ab} = \frac{1}{4} (\gamma^\theta \gamma^\phi)^{ab} R_{\mu\nu\theta\phi},
\] (2.19)

where in calculating \(\Omega_{\mu\nu}\) we have used eq. (2.14) in the definition of \(\Omega\) given in eq. (2.7).

Next, we proceed to compute all the necessary traces which are useful for calculating Seeley-DeWitt coefficients. Since \(a\) varies from 0 to 3, we can write

\[
\text{tr}(I) = \delta^a_a = 4.
\] (2.20)

Also,

\[
\text{tr}(E) = E^a_a = - R.
\] (2.21)

\(^7\)With our choice of four-dimensional space-time, \(\mathcal{D}\) is Hermitian and we can express \(\Lambda = \mathcal{D}^\dagger \mathcal{D} = \mathcal{D}^2\).
\[ \text{tr}(E^2) = E^{ab}E_{ba} = \frac{R^2}{4}. \] (2.22)

After taking the expression for \( \Omega \) from eq. (2.19) and then using gamma contraction identity [33] and Riemann identities (eqs. (A.1) to (A.3)), one can easily write

\[ \text{tr}(\Omega_{\mu\nu}\Omega^{\mu\nu}) = (\Omega_{\mu\nu})^{ab}(\Omega^{\mu\nu})_{ba} \]
\[ = \frac{1}{16}\text{tr}(\gamma^\theta\gamma^\phi\gamma^\rho\gamma^\lambda)R_{\mu\nu\theta\phi}R^{\mu\nu\rho\lambda} \]
\[ = -\frac{1}{2}R_{\mu\nu\rho\sigma}R^{\mu\nu\rho\sigma}. \] (2.23)

Inserting these data into eq. (2.9), we find Seeley-DeWitt coefficients for massless free Dirac spinor field as

\[ (4\pi)^2a_0(x) = 4, \]
\[ (4\pi)^2a_2(x) = -\frac{R}{3}, \] (2.24)
\[ (4\pi)^2a_4(x) = \frac{1}{360}(5R^2 - 8R_{\mu\nu}R^{\mu\nu} - 7R_{\mu\nu\rho\sigma}R^{\mu\nu\rho\sigma}). \]

Our next aim is to study the case of massive free Dirac spinor (with real mass \( m \)) and for that, we have to add a mass term in the Lagrangian given in eq. (2.10),

\[ \mathcal{L} = \bar{\psi}_a \left\{ i(\gamma^\mu)abD_\mu + m\delta^{ab} \right\} \psi_b, \] (2.25)

and the corresponding Laplace-type operator can be obtained by following the technique discussed in [34],

\[ \Lambda = (i\gamma^\mu D_\mu + m) \times (i\gamma^\nu D_\nu - m) \]
\[ = -\gamma^\mu\gamma^\nu D_\mu D_\nu - m^2. \] (2.26)

Proceeding in the same way as for massless Dirac spinor field, we obtain

\[ (E)^{ab} = (m^2 - \frac{R}{4})\delta^{ab}, \]
\[ \text{tr}(E) = 4m^2 - R, \]
\[ \text{tr}(E^2) = 4m^4 - 2m^2R + \frac{R^2}{4}, \] (2.27)

while other matrices like \( I, \omega, \Omega \) and their traces remain exactly same as in eqs. (2.19), (2.20) and (2.23).

Using the results in eq. (2.9), we obtain the Seeley-DeWitt coefficients for massive free Dirac spinor field as

\[ (4\pi)^2a_0(x) = 4, \]
\[ (4\pi)^2a_2(x) = 4m^2 - \frac{R}{3}, \] (2.28)
\[ (4\pi)^2a_4(x) = \frac{1}{360}(720m^4 - 120m^2R + 5R^2 - 8R_{\mu\nu}R^{\mu\nu} - 7R_{\mu\nu\rho\sigma}R^{\mu\nu\rho\sigma}). \]
and for Ricci-flat space, one can set $R = 0$ in eq. (2.28) to arrive at the following result

\[
(4\pi)^2 a_0(x) = 4,
\]
\[
(4\pi)^2 a_2(x) = 4m^2,
\]
\[
(4\pi)^2 a_4(x) = \frac{1}{360} (720m^8 - 8R_{\mu\nu}R^{\mu\nu} - 7R_{\mu\nu\rho\sigma}R^{\mu\nu\rho\sigma}).
\]

(2.29)

### 2.2.2 Dirac Spinor field with gauge Connection

The standard form of Lagrangian for a massless Dirac spinor field $\psi_a$ with gauge field connection $A_\mu$ is given by

\[
\mathcal{L} = i \bar{\psi}_a (\gamma^\mu)_{ab} (D_\mu + A_\mu) \psi_b.
\]

(2.30)

With our choice of space-time which is even dimensional and has euclidean signature, $A_\mu$ is anti-Hermitian in the gauge indices, $A_\mu^\dagger = -A_\mu$; also, $\gamma^\mu D_\mu$ is anti-Hermitian, $(\gamma^\mu D_\mu)^\dagger = -\gamma^\mu D_\mu$; and hence, $\mathcal{D} = i\gamma^\mu (D_\mu + A_\mu)$ is Hermitian. We employ the same approach as we did in § 2.2.1 and find that the relevant second-order differential operator acting on $\psi_a$ takes the following form

\[
\Lambda = \mathcal{D}^2 = i\gamma^\mu (D_\mu + A_\mu) \times i\gamma^\nu (D_\nu + A_\nu) = -\gamma^\mu \gamma^\nu (D_\mu D_\nu + D_\mu A_\nu + A_\nu D_\mu + A_\mu D_\nu + A_\mu A_\nu)
\]
\[
= -(D^\mu D_\mu + \frac{1}{2} \gamma^\mu \gamma^\nu [D_\mu, D_\nu]) - D^\mu A_\mu + \frac{1}{2} \gamma^\mu \gamma^\nu D_\mu A_\nu - (\gamma^\nu \gamma^\mu + \gamma^\mu \gamma^\nu) A_\mu D_\nu
\]
\[
- (A^\mu A_\mu + \frac{1}{2} \gamma^\mu \gamma^\nu [A_\mu, A_\nu])
\]
\[
= -D^\mu D_\mu - \frac{1}{2} \gamma^\mu \gamma^\nu (D_\mu, D_\nu) - \frac{1}{2} \gamma^\mu \gamma^\nu F_{\mu\nu} - D^\mu A_\mu - 2A^\mu D_\mu - A^\mu A_\mu,
\]

(2.31)

where the notation $F_{\mu\nu} = \partial_\mu A_\nu - \partial_\nu A_\mu + [A_\mu, A_\nu]$.

Now, using the result of eq. (2.18) we find that

\[
\bar{\psi}_a \Lambda^{ab} \psi_b = -\delta^{ab} \bar{\psi}_a (D^\mu D_\mu) \psi_b - \left\{ \frac{1}{2} (\gamma^\mu \gamma^\nu)^{ab} F_{\mu\nu} + \delta^{ab} (D^\mu A_\mu + A^\mu A_\mu - \frac{R}{4}) \right\} \bar{\psi}_a \psi_b
\]
\[
- 2\delta^{ab} A^\rho \bar{\psi}_a (D_\rho \psi_b)
\]
\[
= -\delta^{ab} \bar{\psi}_a (D^\mu D_\mu) \psi_b + \left\{ D^\mu (\omega_\mu)^{ab} + (\omega_\mu)^{ac} (\omega_\mu)^b_c - \frac{1}{2} (\gamma^\mu \gamma^\nu)^{ab} F_{\mu\nu}
\]
\[
- \delta^{ab} (D^\mu A_\mu + A^\mu A_\mu - \frac{R}{4}) \right\} \bar{\psi}_a \psi_b + 2 \left\{ (\omega_\mu)^{ab} - \delta^{ab} A^\mu \right\} \bar{\psi}_a (D_\mu \psi_b),
\]

(2.32)

where in writing the final step we have used the definition given in eq. (2.16).
Finally, comparing the form of $\Lambda$ from eq. (2.32) with eq. (2.5) and using eq. (2.6), we identify $I$, $\omega_\mu$, $E$, and $\Omega_{\mu\nu}$ as

\[
(I)^{ab} = \delta^{ab}, \quad \omega_\mu = \delta^{ab} A_\mu,
\]

\[
(E)^{ab} = -D^\mu (\omega_\mu)^{ab} - (\omega_\mu)^{ac}(\omega_\mu)^c_b + \frac{1}{2} (\gamma_\mu \gamma_\nu)^{ab} F_{\mu\nu} + \delta^{ab} (D^\mu A_\mu + A^\mu A_\mu - \frac{R}{4})
\]

\[
= \frac{1}{2} (\gamma_\mu \gamma_\nu)^{ab} F_{\mu\nu} - \frac{R}{4} \delta^{ab},
\]

\[
(\Omega_{\mu\nu})^{ab} = [D_\mu, D_\nu] + D_\mu [\omega_\nu] + [\omega_\mu, \omega_\nu]
\]

\[
= \frac{1}{4} (\gamma^\theta \gamma^\phi)^{ab} R_{\mu\nu\theta\phi} + \delta^{ab} F_{\mu\nu},
\]

where simplifications have been made using the following results

\[
D^\mu (\omega_\mu)^{ab} = \delta^{ab} D^\mu A_\mu, \quad D_\mu [\omega_\nu] = D_\mu A_\nu - D_\nu A_\mu, \quad [\omega_\mu, \omega_\nu] = [A_\mu, A_\nu].
\]

Note that, for obtaining $\Omega$, we have substituted the relation, (2.14) in the definition (2.7).

Now, our task is to calculate all the traces necessary for calculating Seeley-DeWitt coefficients. The results are

\[
\text{tr}(I) = 4,
\]

\[
\text{tr}(E) = -R,
\]

\[
\text{tr}(E^2) = \frac{1}{2} \text{tr}(\gamma_\mu \gamma_\nu) F_{\mu\nu} - \frac{R}{4} R_{\mu\nu} = \frac{1}{4} \text{tr}(\gamma_\mu \gamma_\nu) F_{\mu\nu} F_{\theta\phi} - \frac{R}{8} \text{tr}(\gamma_\mu \gamma_\nu) F_{\mu\nu} + \frac{R^2}{4}
\]

\[
= \frac{R^2}{4} - 2 F_{\mu\nu} F_{\mu\nu},
\]

\[
\text{tr}(\Omega_{\mu\nu} \Omega^{\mu\nu}) = \frac{1}{4} \text{tr}(\gamma^\theta \gamma^\phi) R_{\mu\nu\theta\phi} + \delta^{ab} F_{\mu\nu} = \frac{1}{4} \text{tr}(\gamma^\rho \gamma^\lambda) R_{\mu\nu\rho\lambda} + \delta^{ab} F_{\mu\nu}
\]

\[
= 4 F_{\mu\nu} F_{\mu\nu} - \frac{1}{2} R_{\mu\nu\rho\sigma} R^{\mu\nu\rho\sigma}.
\]

Here, we have used gamma contraction identity [33] and Riemann identities (eqs. (A.1) to (A.3)) for the necessary simplifications.

We use the result of these traces in the formulae (2.9) to calculate the Seeley-DeWitt coefficients for the massless gauged Dirac spinor field,

\[
(4\pi)^2 a_0(x) = 4,
\]

\[
(4\pi)^2 a_2(x) = -\frac{R}{3},
\]

\[
(4\pi)^2 a_4(x) = \frac{1}{360} (5 R^2 - 8 R_{\mu\nu} R^{\mu\nu} - 7 R_{\mu\nu\rho\sigma} R^{\mu\nu\rho\sigma} - 240 F_{\mu\nu} F^{\mu\nu}).
\]
Next, we are going to study the case of massive gauged Dirac spinor field having the following form of Lagrangian

$$\mathcal{L} = \bar{\psi}_a \left\{ i(\gamma^\mu)^{ab} (D_\mu + A_\mu) + \delta^{ab} m \right\} \psi_b. \quad (2.37)$$

To deal with the mass term, we use same technique as we did for massive free Dirac spinor in § 2.2.1 and find the required second-order differential operator as

$$\Lambda = \{ i\gamma^\mu (D_\mu + A_\mu) + m \} \times \{ i\gamma^\nu (D_\nu + A_\nu) - m \} = -\gamma^\mu \gamma^\nu (D_\mu + A_\mu)(D_\nu + A_\nu) - m^2. \quad (2.38)$$

Using the results from eqs. (2.31) and (2.32), we obtain the necessary matrices and traces as

$$\begin{align*}
(E)^{ab} &= \frac{1}{2} (\gamma^\mu \gamma^\nu)^{ab} F_{\mu\nu} + (m^2 - \frac{R}{4}) \delta^{ab}, \\
\text{tr}(E) &= \frac{1}{2} \text{tr}(\gamma^\mu \gamma^\nu) F_{\mu\nu} + (m^2 - \frac{R}{4}) \delta_a^a \\
&= 4m^2 - R, \\
\text{tr}(E^2) &= \left\{ \frac{1}{2} (\gamma^\mu \gamma^\nu)^{ab} F_{\mu\nu} + (m^2 - \frac{R}{4}) \delta^{ab} \right\} \times \left\{ \frac{1}{2} (\gamma^\theta \gamma^\phi)^{ba} F_{\theta\phi} + (m^2 - \frac{R}{4}) \delta^{ba} \right\} \\
&= \frac{1}{4} \text{tr}(\gamma^\mu \gamma^\nu \gamma^\theta \gamma^\phi) F_{\mu\nu} F_{\theta\phi} + 2 \times \frac{1}{2} (m^2 - \frac{R}{4}) \text{tr}(\gamma^\mu \gamma^\nu) F_{\mu\nu} + 4(m^2 - \frac{R}{4})^2 \\
&= 4m^4 - 2m^2 R + \frac{R^2}{4} - 2F_{\mu\nu} F^{\mu\nu},
\end{align*} \quad (2.39)$$

while other matrices $I, \omega$ and $\Omega$, and their traces remain exactly the same as in eqs. (2.33) and (2.35).

Now, substituting this data in the formulae (2.9), we obtain Seeley-DeWitt coefficients for the massive gauged Dirac spinor field as

$$\begin{align*}
(4\pi)^2 a_0(x) &= 4, \\
(4\pi)^2 a_2(x) &= 4m^2 - \frac{R}{3}, \\
(4\pi)^2 a_4(x) &= \frac{1}{360} (720m^4 - 120m^2 R + 5R^2 - 8R_{\mu\nu} R^{\mu\nu} - 7R_{\mu\nu\rho\sigma} R^{\mu\nu\rho\sigma} - 240F_{\mu\nu} F^{\mu\nu}). \quad (2.40)
\end{align*}$$

If Ricci-flat space is considered, then for that special case, we have to set $R = 0$ in eq. (2.40) in order to obtain corresponding Seeley-DeWitt coefficients. The result is

$$\begin{align*}
(4\pi)^2 a_0(x) &= 4, \\
(4\pi)^2 a_2(x) &= 4m^2, \\
(4\pi)^2 a_4(x) &= \frac{1}{360} (720m^4 - 8R_{\mu\nu} R^{\mu\nu} - 7R_{\mu\nu\rho\sigma} R^{\mu\nu\rho\sigma} - 240F_{\mu\nu} F^{\mu\nu}). \quad (2.41)
\end{align*}$$
3 Spin-3/2 Rarita-Schwinger field

The spin-3/2 particle theory was first proposed by W. Rarita and J. Schwinger [35], based on Fierz and Pauli construction of field theory with arbitrary spins. In four-dimensional space-time, the Lagrangian of a massless free RS field $\psi_{\mu a}$ [36] is given by

$$ L_{RS} = -i \bar{\psi}_{\mu a} (\gamma^{\mu \lambda \nu})^{ab} (D_\lambda \psi_{\nu b}), \quad (3.1) $$

where $\gamma^{\mu \lambda \nu}$ is the antisymmetrized product of gamma matrices with respect to the indices $\mu, \lambda,$ and $\nu$. Using the relation (2.11), one can simplify $\gamma^{\mu \lambda \nu}$ and rewrite $L_{RS}$ as

$$ L_{RS} = -i \frac{2}{\sqrt{2}} \bar{\psi}_{\mu a} (\gamma^{\nu \lambda \mu} \gamma^{\nu \lambda \mu})^{ab} (D_\lambda \psi_{\nu b}). \quad (3.2) $$

We gauge fix the theory by adding the following gauge fixing term to the Lagrangian in eq. (3.2)

$$ L_{GF} = i \frac{2}{\sqrt{2}} \bar{\psi}_{\mu a} (\gamma^{\nu \lambda \mu} \gamma^{\nu \lambda \mu})^{ab} (D_\lambda \psi_{\nu b}). \quad (3.3) $$

As a result, the total gauge fixed Lagrangian takes the following form

$$ L = L_{RS} + L_{GF} = -i \bar{\psi}_{\mu a} (\gamma^{\nu \lambda \mu} \gamma^{\nu \lambda \mu})^{ab} (D_\lambda \psi_{\nu b}). \quad (3.4) $$

The Lagrangian consists of a first-order Dirac-type differential operator $D^{\mu \nu} \equiv \frac{1}{\sqrt{2}} \gamma^\rho \beta^\gamma \gamma^\rho \mu \nu D_\lambda$ and with our choice of space-time, $D^\lambda$ is Hermitian. In order to obtain the corresponding second-order Laplace-type operator, let’s consider

$$ \Lambda^{\mu \nu} = (D^2)^{\mu \nu} = D^{\mu \sigma} D^\sigma_{\nu} $$

$$ = \left( \frac{i}{\sqrt{2}} \gamma^\sigma \gamma^\rho \gamma^\mu \rho D_\rho \right) \times \left( \frac{i}{\sqrt{2}} \gamma^{\nu \lambda \mu} \gamma_{\sigma} D_\lambda \right) $$

$$ = -\frac{1}{2} (\gamma^\rho \gamma^\mu \gamma^\rho \gamma^\nu \gamma^\mu \gamma^{\nu \lambda \mu} \gamma_{\sigma} D_\lambda + \gamma^\rho \gamma^\mu \gamma^\rho \gamma^\nu \gamma^\rho \gamma^\mu \gamma^{\nu \lambda \mu} \gamma_{\sigma} D_\lambda) $$

$$ = -g^{\mu \nu} (D^\rho D_\rho) + \frac{1}{4} \left[ \gamma_{\mu \nu} \gamma_{\mu \nu} \gamma^\rho \gamma^\mu \gamma^{\rho \lambda \mu} \gamma_{\sigma} D_\lambda + \gamma_{\mu \nu} \gamma_{\mu \nu} \gamma^\rho \gamma^\mu \gamma^{\rho \lambda \mu} \gamma_{\sigma} D_\lambda \right], $$

where equality in the third line is obtained using the gamma matrix contraction identity [33], and in writing the final expression, we have used the following two relations (3.6) and (3.7)

$$ \gamma^\lambda \gamma^\rho \mu \gamma^\nu \gamma^\rho \mu \gamma^\nu \gamma_{\mu \nu} \gamma^\rho \mu \nu D_\rho D_\lambda = \frac{1}{2} \left\{ \gamma^\lambda \gamma^\rho \mu \gamma^\nu \gamma_{\mu \nu} \gamma^\rho \mu \nu D_\rho D_\lambda + \gamma^\rho \gamma_{\mu \nu} \gamma^\rho \mu \nu D_\rho D_\lambda \right\} $$

$$ = \frac{1}{2} \left\{ (8 g^\rho \gamma^\rho \gamma^\nu \gamma^\rho \gamma^\mu \gamma^\nu - \gamma^\rho \gamma^\rho \gamma^\nu \gamma^\rho \gamma^\nu) D_\rho D_\lambda + \gamma^\rho \gamma_{\mu \nu} \gamma^\rho \mu \nu D_\rho D_\lambda \right\} $$

$$ = \frac{1}{2} \left\{ (2 \gamma^\rho \gamma^\rho \gamma^\nu \gamma_{\mu \nu} \gamma^\rho - \gamma^\rho \gamma^\rho \gamma_{\mu \nu} \gamma^\rho) D_\rho D_\lambda \right\}, \quad (3.6) $$

and similarly

$$ \gamma^\nu \gamma^\rho \gamma^\mu \gamma^\nu \gamma^\rho \mu \nu D_\rho D_\lambda = \frac{1}{2} \left\{ (2 \gamma^\nu \gamma^\rho \gamma^\nu \gamma_{\mu \nu} \gamma^\rho - \gamma^\nu \gamma_{\mu \nu} \gamma^\rho) D_\rho D_\lambda \right\}. \quad (3.7) $$

\(^8\)see Appendix B for details
In order to simplify the expression eq. (3.5), we now consider

\[
\bar{\psi}_{\mu a}(\Lambda^{\mu \nu})^{ab}\psi_{\nu b} = -g^{\mu \nu}\delta^{ab}\bar{\psi}_{\mu a}(D^\rho D_\rho)\psi_{\nu b} + \frac{1}{4}(\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\mu \gamma^\lambda \gamma^\rho)^{ab}\bar{\psi}_{\mu a}[D_\rho, D_\lambda] \psi_{\nu b} \\
= -g^{\mu \nu}\delta^{ab}\bar{\psi}_{\mu a}(D^\rho D_\rho)\psi_{\nu b} - \frac{1}{4}(\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\mu \gamma^\lambda \gamma^\rho)^{ab} R^\nu_{\sigma\rho\lambda}\bar{\psi}_{\mu a} \psi_{\nu b} \\
+ \frac{1}{32}(\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\mu \gamma^\lambda \gamma^\rho)^{ac} R_{\rho\lambda\theta\phi}[\gamma^\theta, \gamma^\phi] b^c \bar{\psi}_{\mu a} \psi_{\nu b},
\]

(3.8)

where we have used the commutation identity in the last step,

\[
[D_\rho, D_\lambda] \psi_{\nu b} = -R^\rho_{\nu \sigma \rho \lambda} \psi_{\sigma b} + \frac{1}{8} R_{\rho \lambda \theta \phi}[\gamma^\theta, \gamma^\phi] b^c \psi_{\nu c}. \tag{3.9}
\]

Now, one can proceed in a systematic manner and simplify the following Riemann-gamma products (Appendix C) as

\[
(\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\mu \gamma^\lambda \gamma^\rho) R^\nu_{\sigma\rho\lambda} = -4 R^{\mu \nu},
\]

\[
(\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\mu \gamma^\lambda \gamma^\rho) R_{\rho\lambda\theta\phi}[\gamma^\theta, \gamma^\phi] = 16(\gamma^\rho \gamma^\theta R^{\mu \nu} + \gamma^\mu \gamma^\theta R^\nu_{\rho \theta} - \gamma^\nu \gamma^\theta R^\mu_{\rho \theta})
\]

\[
-8 R (\gamma^\mu \gamma^\nu - g^{\mu \nu}).
\]

Using eq. (3.10), we get the final form of Laplace-type differential operator as

\[
\Lambda = -g^{\mu \nu}\delta^{ab}D^\rho D_\rho + \delta^{ab} R^{\mu \nu} - \frac{1}{2}(\gamma^\rho \gamma^\theta)^{ab} R^{\mu \nu} + \frac{1}{2}(\gamma^\mu \gamma^\theta)^{ab} R^\nu_\theta \\
- \frac{1}{2}(\gamma^\nu \gamma^\theta)^{ab} R^\mu_\theta - \frac{R}{4}(\gamma^\mu \gamma^\nu)^{ab} + \frac{R}{4} \delta^{ab} g^{\mu \nu}. \tag{3.11}
\]

Note that, we have set \( \omega = 0 \) in the following definition as \( \omega \) vanishes for any free field.

\[
D_\alpha \psi_{\mu a} = D_\alpha \psi_{\mu a} + (\omega_\alpha)_{\mu a} \psi_{\nu b} \tag{3.12}
\]

Comparing \( \Lambda \) from eq. (3.11) with eq. (2.5), we identify \( I, E \) and \( \Omega_{\mu \nu} \) as

\[
I^{\mu \nu ab} = g^{\mu \nu} \delta^{ab},
\]

\[
E^{\mu \nu ab} = -\delta^{ab} R^{\mu \nu} + \frac{1}{2}(\gamma^\rho \gamma^\theta)^{ab} R^{\mu \nu} + \frac{1}{2}(\gamma^\mu \gamma^\theta)^{ab} R^\nu_\theta \\
+ \frac{1}{2}(\gamma^\nu \gamma^\theta)^{ab} R^\mu_\theta + \frac{R}{4}(\gamma^\mu \gamma^\nu)^{ab} - \frac{R}{4} \delta^{ab} g^{\mu \nu}, \tag{3.13}
\]

\[
(\Omega_{\mu \nu})^{ab \gamma \delta} = \delta^{ab} R^{\gamma \delta}_{\mu \nu} + \frac{1}{8} g^{\gamma \delta} R^{\alpha \beta}_{\mu \nu \rho \sigma}[\gamma^\rho, \gamma^\sigma]^{ab},
\]

where we have used eqs. (3.9) and (3.12) in the definition of \( \Omega \) given in eq. (2.7) to obtain its present form.

### 3.1 Trace calculations

Now, we compute the traces necessary for evaluation of Seeley-DeWitt coefficients using the matrices (3.13). Note that for this purpose, we will make use of Riemann identities.
listed in eqs. (A.1) to (A.3), and the necessary gamma trace and contraction identities [33].

Since both $\mu$ and $a$ change from 0 to 3,

$$\text{tr}(I) = \delta^\mu_\mu \delta^a_a = 16. \quad (3.14)$$

$$\text{tr}(E) = E^{\mu a}_{\mu a}$$

$$= g_{\mu \nu} \delta_{ab} \left\{ -\delta^{ab} R_{\mu \nu} + \frac{1}{2} (\gamma^\rho \gamma^\theta)_{\mu \nu} R_{\rho \theta} - \frac{1}{2} (\gamma^\mu \gamma^\nu)_{ab} R_{\mu \nu} + \frac{1}{2} (\gamma^\nu \gamma^\theta)_{ab} R_{\nu \theta} + \frac{R}{4} (\gamma^\mu \gamma^\nu)_{ab} - \frac{R}{4} \delta^{ab} g_{\mu \nu} \right\} \quad (3.15)$$

$$= -\delta^a_a R + 0 - \frac{1}{2} \text{tr}(\gamma^\mu \gamma^\nu) R_{\mu \theta} + \frac{1}{2} \text{tr}(\gamma^\nu \gamma^\theta) R_{\nu \theta} + \frac{R}{4} \text{tr}(\gamma^\mu \gamma^\nu) - \frac{R}{4} \delta^a_a \delta^\mu_\mu$$

$$= -4R,$$  

$$\text{tr}(E^2) = E^{\mu a b} E_{\nu b \mu a}$$

$$= \begin{pmatrix} B & C & D & G \\ \frac{1}{2} \delta^{ab} R_{\mu \nu} + \frac{1}{2} (\gamma^\rho \gamma^\theta)_{\mu \nu} R_{\rho \theta} & -\frac{1}{2} (\gamma^\mu \gamma^\nu)_{ab} R_{\mu \nu} + \frac{1}{2} (\gamma^\nu \gamma^\theta)_{ab} R_{\nu \theta} + \frac{R}{4} (\gamma^\mu \gamma^\nu)_{ab} - \frac{R}{4} \delta^{ab} g_{\mu \nu} & \frac{R}{4} (\gamma^\mu \gamma^\nu)_{ab} - \frac{R}{4} \delta^{ab} g_{\mu \nu} \\ \frac{3}{2} & -\frac{1}{2} (\gamma^\mu \gamma^\nu)_{ab} R_{\mu \nu} + \frac{1}{2} (\gamma^\nu \gamma^\theta)_{ab} R_{\nu \theta} + \frac{R}{4} (\gamma^\mu \gamma^\nu)_{ab} - \frac{R}{4} \delta^{ab} g_{\mu \nu} & \frac{R}{4} (\gamma^\mu \gamma^\nu)_{ab} - \frac{R}{4} \delta^{ab} g_{\mu \nu} \\ \frac{5}{4} & \frac{R}{4} (\gamma^\mu \gamma^\nu)_{ab} - \frac{R}{4} \delta^{ab} g_{\mu \nu} & \frac{R}{4} (\gamma^\mu \gamma^\nu)_{ab} - \frac{R}{4} \delta^{ab} g_{\mu \nu} \end{pmatrix}. \quad (3.16)$$

Note that each term in eq. (3.16) is denoted by a corresponding symbol, and now we are going compute their products separately as follows

$$A1 = 4R_{\mu \nu} R^{\mu \nu}.$$  

$$C3 = \frac{1}{4} \text{tr}(\gamma^\rho \gamma^\theta \gamma^\mu \gamma^\nu) R_{\rho \theta} R_{\mu \phi} = R^2.$$  

$$F5 = \frac{R^2}{16} \text{tr}(\gamma^\mu \gamma^\nu \gamma^\mu \gamma^\nu R_{\mu \nu}) = 4R^2.$$  

$$A2 = B1 = -\frac{1}{2} \text{tr}(\gamma^\sigma \gamma^\mu \gamma^\phi) R_{\mu \nu} R_{\nu \sigma \phi}.$$  

$$A3 = C1 = \frac{1}{2} \text{tr}(\gamma^\nu \gamma^\phi) R_{\mu \nu} R_{\mu \phi} = 2R_{\mu \nu} R^{\mu \nu}.$$  

$$A4 = D1 = -\frac{1}{2} \text{tr}(\gamma^\mu \gamma^\phi) R_{\mu \nu} R_{\nu \phi} = -2R_{\mu \nu} R^{\mu \nu}.$$  

$$A5 = F1 = \frac{R}{4} \text{tr}(\gamma^\mu \gamma^\nu) = -R^2.$$  

$$A6 = G1 = R^2.$$  

$$B3 = C2 = -\frac{1}{4} \text{tr}(\gamma^\rho \gamma^\theta \gamma^\mu \gamma^\nu) R_{\rho \theta} R_{\mu \phi}.$$
\( B_4 = D_2 = \frac{1}{4} \text{tr}(\gamma^\rho \gamma^\theta \gamma^\mu \gamma^\phi) R_{\mu\nu\rho\theta} R^\nu_{\phi} \)

\( = -2R_{\mu\nu} R^\mu\nu. \)

\( B_6 = G_2 = -\frac{R}{8} g_{\nu\mu} \text{tr}(\gamma^\rho \gamma^\mu) R_{\mu\nu \theta} \theta \)

\( = 0. \)

\( C_5 = F_3 = -\frac{R}{8} \text{tr}(\gamma^\mu \gamma^\theta \gamma^\nu \gamma_{\mu \nu}) R_{\mu\theta} \theta \)

\( = -2R^2. \)

\( D_5 = F_4 = \frac{R}{8} \text{tr}(\gamma^\nu \gamma^\theta \gamma^\mu) R_{\mu\theta} \theta \)

\( = -R^2. \)

\( F_6 = G_5 = -\frac{R^2}{16} g_{\nu\mu} \text{tr}(\gamma^\mu \gamma^\nu) \)

\( = -R^2. \)

One may use the results of these terms in eq. (3.16) and finally can come up with the following result

\[ \text{tr}(E^2) = 2R_{\mu\nu\rho\sigma} R^{\mu\nu\rho\sigma} + R^2. \quad (3.17) \]

We will also use the result for \( \Omega \) from eq. (3.13) and evaluate

\[ \text{tr}(\Omega_{\mu\nu} \Omega^{\mu\nu}) = (\Omega_{\mu\nu})^{\alpha\beta\lambda\gamma} (\Omega^{\mu\nu})_{\beta\lambda\alpha} \]

\[ = \left\{ \delta^{ab} R^\alpha_{\mu\nu} + \frac{1}{4} g^{\alpha\beta} (\gamma^\rho \gamma^\lambda)_{ab} R_{\mu\nu \rho \lambda} \right\} \times \left\{ \delta_{ba} R_{\beta\gamma}^{\mu\nu} + \frac{1}{4} g_{ba} (\gamma^\theta \gamma^\phi)_{ba} R_{\mu\nu \theta \phi} \right\} \]

\[ = -4R_{\mu\nu\rho\sigma} R^{\mu\nu\rho\sigma} + 2 \times \frac{1}{4} g^{\alpha\beta} \text{tr}(\gamma^\theta \gamma^\phi) R_{\alpha\beta\mu\nu} R_{\mu\nu \theta \phi} + \frac{1}{4} \text{tr}(\gamma^\rho \gamma^\lambda \gamma^\theta \gamma^\phi) R_{\mu\nu \rho \lambda} R_{\mu\nu \theta \phi} \]

\[ = -4R_{\mu\nu\rho\sigma} R^{\mu\nu\rho\sigma} + 0 - 2R_{\mu\nu\rho\sigma} R^{\mu\nu\rho\sigma} \]

\[ = -6R_{\mu\nu\rho\sigma} R^{\mu\nu\rho\sigma}. \quad (3.18) \]

### 3.2 Seeley-DeWitt coefficients

One can substitute all the traces calculated in § 3.1 in the standard formulae (2.9) in order to find the leading Seeley-DeWitt coefficients for the case of massless free spin-3/2 Rarita-Schwinger fermions. The result is

\[ (4\pi)^2 a_0(x) = 16, \]

\[ (4\pi)^2 a_2(x) = -\frac{4}{3} R, \]

\[ (4\pi)^2 a_4(x) = \frac{1}{360} (212R_{\mu\nu\rho\sigma} R^{\mu\nu\rho\sigma} - 32R_{\mu\nu} R^{\mu\nu} + 20R^4). \quad (3.19) \]
The above result of Seeley-DeWitt coefficients is for any arbitrary manifold. However, for Ricci-flat space, again one has to substitute $R = 0$ in eq. (3.19), to obtain the following result

\begin{align}
(4\pi)^2a_0(x) &= 16, \\
(4\pi)^2a_2(x) &= 0, \\
(4\pi)^2a_4(x) &= \frac{1}{360}(212R_{\mu\nu\rho\sigma}R^{\mu\nu\rho\sigma} - 32R_{\mu\nu}R^{\mu\nu}).
\end{align} 

(3.20)

4 Summary

In this report, we have computed the first three Seeley-Dewitt coefficients for the massless free spin-3/2 field and expressed them in terms of the local invariants of the theory. We started with the discussion of the general heat kernel approach and worked out a practice calculation for Seeley-DeWitt coefficients for spin-1/2 field as an elementary example. Then, we applied the same approach to calculate the Seeley-DeWitt coefficients for spin-3/2 Rarita-Schwinger field. Apart from various interests, spin-3/2 Rarita-Schwinger field has a particular role in supergravity and evolution of the universe. However, we are interested in computing the heat kernel coefficients for the same in any arbitrary background as these coefficients have various applications in quantum gravity, quantum field theory, and black hole entropy corrections (mainly logarithmic corrections). One can employ these results of Seeley-DeWitt coefficients to compute the heat kernel coefficients by integrating them over the manifold of interest as discussed in § 2.1. We also note that the derivation in this paper assumes that $\psi$ is a Dirac spinor. Anyone interested in computing the heat kernel coefficients for Majorana or Weyl fermions instead of Dirac fermions can simply divide the results by two, since Weyl and Majorana spinors have half the degrees of freedom of Dirac spinor.

A Curvature tensor conventions

Everything we wish to know about the curvature of a manifold is given by, Riemann tensor (Schutz 1985) or Riemann-Christoffel tensor (Weinberg 1972). It is a four-index tensor that is usually expressed as $R^\alpha_{\beta\gamma\delta}$. In our work, we have used the following identities and symmetries of Riemann tensor

\begin{align}
R_{\alpha\beta\gamma\delta} &= -R_{\beta\alpha\gamma\delta} = -R_{\alpha\delta\gamma\beta} \quad \text{(Skew symmetry)}, \\
R_{\alpha\beta\gamma\delta} &= R_{\gamma\delta\alpha\beta} \quad \text{(Interchange symmetry)}, \\
R^\alpha_{\beta\gamma\delta} + R^\alpha_{\gamma\delta\beta} + R^\alpha_{\delta\beta\gamma} &= 0 \quad \text{(Bianchi identity)}.
\end{align} 

(A.1)
In our convention, we contract first and third index (or second and fourth index) of Riemann tensor to form symmetric Ricci tensor.

\[ R^\alpha_{\beta\alpha\delta} = R_{\beta\alpha\delta} = R_{\beta\delta} = R_{\delta\beta}, \]
\[ R^\alpha_{\sigma\gamma\delta} = R_{\alpha\beta\gamma} = 0. \] (A.2)

We may contract \( R_{\beta\delta} \) further to obtain Ricci scalar

\[ g^{\beta\delta} R_{\beta\delta} = R^\beta = R. \] (A.3)

One has to set \( R = 0 \) while considering Ricci flat space-time.

### B Antisymmetrized gamma product

In Clifford algebra, antisymmetrized product of gamma matrices is defined as

\[ \gamma_{a_1,a_2,\ldots,a_n} = \frac{1}{n!} \sum_P (-1)^P \gamma_{a_1} \gamma_{a_2} \cdots \gamma_{a_n}, \] (B.1)

where \( P \) stands for the type of permutations, i.e. even or odd.

\[ \therefore \quad \gamma^{\mu\lambda\nu} = \frac{1}{6} \{ \gamma^{\mu\lambda\gamma\nu} + \gamma^{\lambda\gamma\mu\nu} + \gamma^{\nu\lambda\gamma\mu} - \gamma^{\nu\gamma\lambda\mu} - \gamma^{\gamma\nu\lambda\mu} - \gamma^{\gamma\lambda\mu\nu} \}. \] (B.2)

Now, using eq. (2.11) each term of eq. (B.2) can be expressed as

\[ \gamma^{\lambda\nu\gamma\mu} = 2g^{\mu\nu}\gamma^{\lambda} - 2g^{\mu\lambda}\gamma^{\gamma} + \gamma^{\nu\lambda}\gamma^{\mu}, \]
\[ \gamma^{\gamma\mu\lambda\nu} = 2g^{\mu\lambda}\gamma^{\gamma} - 2g^{\lambda\gamma}\gamma^{\nu} + \gamma^{\lambda\gamma\mu}\gamma^{\nu}, \]
\[ \gamma^{\nu\gamma\lambda\mu} = 2g^{\nu\lambda}\gamma^{\gamma} - 2g^{\gamma\lambda}\gamma^{\mu} + \gamma^{\nu\gamma\lambda}\gamma^{\mu}. \] (B.3)

Substituting results of eq. (B.3) in eq. (B.2), one can easily get

\[ \gamma^{\mu\lambda\nu} = \frac{1}{2} (\gamma^{\mu\lambda\gamma\nu} - \gamma^{\nu\gamma\lambda\mu}). \] (B.4)

### C Riemann-gamma products

In this section, we aim to derive the simplified form of Riemann-Gamma products which were encountered in § 3.

We may express,

\[ \gamma^\mu \gamma^\lambda \gamma^\mu \gamma^\sigma R^\nu_{\sigma\rho\lambda} = \frac{1}{3} \left( \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\sigma R^\nu_{\sigma\rho\lambda} + \gamma^\lambda \gamma^\sigma \gamma^\mu \gamma^\rho R^\nu_{\rho\lambda\sigma} + \gamma^\sigma \gamma^\rho \gamma^\mu R^\nu_{\lambda\sigma\rho} \right), \] (C.1)

where using gamma identity eq. (2.11) and Riemann identities (eqs. (A.1) to (A.3)), we have

\[ I = (2g^{\rho\mu}\gamma^\lambda \gamma^\sigma - 2g^{\rho\sigma}\gamma^\lambda \gamma^\mu + 2g^{\rho\lambda}\gamma^\gamma \gamma^\mu - 2g^{\rho\gamma}\gamma^\lambda \gamma^\mu + \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\sigma) R^\nu_{\rho\lambda\sigma} \]
\[ = 2\gamma^\lambda \gamma^\sigma R^\nu_{\rho\mu\lambda\sigma} - 2\gamma^\rho \gamma^\sigma R^\nu_{\rho\mu\sigma\lambda} + 2\gamma^\rho \gamma^\sigma R^\nu_{\rho\lambda\sigma\mu} - 2\gamma^\rho \gamma^\lambda \gamma^\nu R^\nu_{\rho\sigma\mu\lambda} + \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\sigma R^\nu_{\rho\sigma\mu\lambda} \]
\[ = 2\gamma^\sigma \gamma^\rho R^\nu_{\sigma\rho\mu\lambda} - 2\gamma^\gamma \gamma^\rho R^\nu_{\gamma\rho\mu\lambda} - 2\gamma^\gamma \gamma^\rho R^\nu_{\gamma\sigma\rho\mu} - 2\gamma^\rho \gamma^\lambda \gamma^\nu R^\nu_{\rho\lambda\mu\sigma} + \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\sigma R^\nu_{\rho\lambda\mu\sigma} \]
\[ = 2\gamma^\sigma \gamma^\rho R^\nu_{\sigma\rho\mu\lambda} - 4\gamma^\gamma \gamma^\rho R^\nu_{\gamma\rho\mu\lambda} - 2\gamma^\rho \gamma^\lambda \gamma^\nu R^\nu_{\rho\lambda\mu\sigma} + \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\sigma R^\nu_{\rho\lambda\mu\sigma}, \] (C.2)
\[ H = (2g^{\lambda \gamma} \gamma^\rho - 2g^{\sigma \rho} \gamma^\lambda \gamma^\mu - 2g^{\sigma \mu} \gamma^\rho \gamma^\lambda + \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\sigma) R^{\nu \lambda \sigma \rho} \]
\[ = 2\gamma^\sigma \gamma^\rho R^{\nu \lambda \sigma \rho} + 2\gamma^\rho \rho \gamma^\lambda \gamma^\mu \gamma^\nu - 2\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu \gamma^\lambda + \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\sigma R^{\nu \lambda \sigma \rho} \]
\[ = 2\gamma^\sigma \gamma^\rho R^{\nu \lambda \sigma \rho} - 2\gamma^\rho \rho \gamma^\mu R^{\nu \lambda \sigma \rho} - 2\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu + \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu R^{\nu \lambda \sigma \rho}. \] (C.3)

Substituting eqs. (C.2) and (C.3) in eq. (C.1), one may obtain

\[ \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu R^{\nu \sigma \rho \lambda} = \frac{1}{3} \left( -6\gamma^\sigma \gamma^\nu R^{\nu \lambda \sigma} + 4\gamma^\sigma \gamma^\rho R^{\nu \mu \sigma \rho} - 2\gamma^\rho \gamma^\lambda \left( R^{\nu \rho \lambda \sigma} + R^{\nu \rho \lambda \mu} \right) \gamma^\rho \right) \]
\[ + \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu \left( R^{\nu \rho \lambda \sigma} + R^{\nu \rho \lambda \mu} \right) \gamma^\rho \gamma^\mu \gamma^\sigma \gamma^\nu R^{\nu \lambda \sigma \rho}. \] (C.4)

\[ \therefore \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu R^{\nu \sigma \rho \lambda} = 2(\gamma^\sigma \gamma^\rho R^{\nu \mu \rho \sigma} - \gamma^\sigma \gamma^\rho R^{\nu \sigma \rho \lambda}). \] (C.5)

Similarly,

\[ \gamma^\sigma \gamma^\mu \gamma^\lambda \gamma^\rho \gamma^{\nu \rho \lambda \sigma}\]
\[ = \frac{1}{3} \left( \gamma^\sigma \gamma^\mu \gamma^\lambda \gamma^\rho R^{\nu \sigma \rho \lambda} + \gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\sigma R^{\nu \rho \lambda \sigma} + \gamma^\lambda \gamma^\mu \gamma^\rho \gamma^\sigma R^{\nu \lambda \sigma \rho} \right). \] (C.6)

where

\[ \text{III} = (2g^{\nu \mu \sigma} \gamma^\nu \gamma^\lambda - 2g^{\sigma \rho} \gamma^\nu \gamma^\lambda + 2g^{\sigma \mu} \gamma^\rho \gamma^\lambda - 2g^{\sigma \rho} \gamma^\nu \gamma^\lambda + \gamma^\rho \gamma^\nu \gamma^\lambda \gamma^\rho) R^{\nu \rho \lambda \sigma} \]
\[ = 2\gamma^\sigma \gamma^\nu R^{\nu \mu \sigma \rho} - 4\gamma^\mu \gamma^\rho R^{\nu \nu \lambda \rho} - 2\gamma^\rho \gamma^\nu \gamma^\nu \gamma^\rho \gamma^\nu \gamma^\rho + \gamma^\rho \gamma^\nu \gamma^\lambda \gamma^\rho R^{\nu \rho \lambda \sigma}. \] (C.7)

and

\[ \text{IV} = (2g^{\nu \mu \gamma} \gamma^\nu \gamma^\lambda - 2g^{\sigma \rho} \gamma^\nu \gamma^\lambda + 2g^{\sigma \mu} \gamma^\rho \gamma^\lambda - 2g^{\sigma \rho} \gamma^\nu \gamma^\lambda + \gamma^\rho \gamma^\nu \gamma^\mu \gamma^\rho) R^{\nu \lambda \sigma \rho} \]
\[ = 2\gamma^\rho \gamma^\nu R^{\nu \mu \rho \lambda} - 2\gamma^\mu \gamma^\nu R^{\nu \nu \rho \lambda} - 2\gamma^\rho \gamma^\nu \gamma^\nu \gamma^\rho \gamma^\nu \gamma^\rho + \gamma^\rho \gamma^\nu \gamma^\mu \gamma^\rho R^{\nu \lambda \sigma \rho}. \] (C.8)

Replacing these two in eq. (C.6), and again using eqs. (A.1) to (A.3)

\[ \gamma^\sigma \gamma^\mu \gamma^\lambda \gamma^\rho \gamma^{\nu \rho \lambda \sigma} = \frac{1}{3} \left( 4g^{\nu \sigma \rho} R^{\nu \mu \rho \sigma} - 6\gamma^\mu \gamma^\rho R^{\nu \nu \rho \sigma} - 2\gamma^\rho \gamma^\nu \gamma^\rho \gamma^\nu \gamma^\rho \gamma^{\nu \nu \rho \sigma} \right) \]
\[ + \gamma^\rho \gamma^\nu \gamma^\mu \gamma^\rho \gamma^{\nu \sigma \rho \lambda} \}
\[ \therefore \gamma^\sigma \gamma^\mu \gamma^\lambda \gamma^\rho \gamma^{\nu \rho \lambda \sigma} = -2(\gamma^\sigma \gamma^\mu R^{\nu \nu \rho \sigma} + \gamma^\sigma \gamma^\mu R^{\nu \mu \rho \sigma}). \] (C.9)

Adding up eqs. (C.5) and (C.10), we find following result

\[ (\gamma^\rho \gamma^\nu \gamma^\mu \gamma^\rho + \gamma^\sigma \gamma^\mu \gamma^\lambda \gamma^\rho) R^{\nu \sigma \rho \lambda} = -2(\gamma^\sigma \gamma^\mu + \gamma^\mu \gamma^\rho) R^{\nu \sigma \rho \lambda} = -4R^{\nu \mu \rho \sigma}. \] (C.11)

Similarly, we can express

\[ \gamma^\rho \gamma^\nu \gamma^\mu \gamma^\rho R^{\nu \mu \rho \sigma} = \frac{1}{3} \left( \gamma^\rho \gamma^\nu \gamma^\mu \gamma^\rho R^{\nu \mu \rho \sigma} + \gamma^\rho \gamma^\nu \gamma^\mu \gamma^\rho R^{\nu \mu \rho \sigma} + \gamma^\rho \gamma^\nu \gamma^\mu \gamma^\rho R^{\nu \mu \rho \sigma} \right). \] (C.12)
where using eq. (2.11) and eqs. (A.1) to (A.3), we have

\[
V = (2g^{\mu \phi} \gamma^\mu \gamma^\phi - 2g^{\mu \phi} \gamma^\mu \gamma^\phi + \gamma^\mu \gamma^\nu \gamma^\theta \gamma^\phi) R_{\mu \theta \phi \nu} \\
= -2 \gamma^\mu \gamma^\phi R_{\mu \phi} + \gamma^\mu \gamma^\nu \gamma^\theta \gamma^\phi R_{\mu \theta \phi \nu},
\]

(C.13)

and

\[
VI = (2g^{\mu \phi} \gamma^\mu \gamma^\phi - 2g^{\mu \phi} \gamma^\mu \gamma^\phi + \gamma^\mu \gamma^\nu \gamma^\theta \gamma^\phi) R_{\mu \phi \theta \theta} \\
= -4 \gamma^\mu \gamma^\phi R_{\mu \theta} + \gamma^\mu \gamma^\nu \gamma^\theta \gamma^\phi R_{\mu \phi \theta \theta}.
\]

(C.14)

One can use eqs. (C.13) and (C.14) to obtain the simplified form of eq. (C.12) as

\[
\gamma^\mu \gamma^\nu \gamma^\theta \gamma^\phi R_{\mu \nu \theta \phi} = \frac{1}{3} \left\{ -6 \gamma^\mu \gamma^\theta R_{\mu \theta} + \gamma^\mu \gamma^\nu \gamma^\theta \gamma^\phi (R_{\mu \nu \theta \phi} + R_{\mu \theta \nu \phi} + R_{\mu \phi \nu \theta}) \right\} \\
= -2 \gamma^\mu \gamma^\theta R_{\mu \theta} \\
= - (\gamma^\mu \gamma^\theta + \gamma^\theta \gamma^\mu) R_{\mu \theta} \ (\because R_{\mu \theta} \text{ is symmetric}) \\
= -2 R.
\]

(C.15)

\[
\therefore \gamma^\mu \gamma^\nu \gamma^\theta \gamma^\phi R_{\mu \nu \theta \phi} = -2 R. \quad (C.16)
\]

Recalling the gamma commutation,

\[
[\gamma^\theta, \gamma^\phi] = 2 \gamma^\theta \gamma^\phi - 2g^{\theta \phi}, \quad (C.17)
\]

we express

\[
(\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\mu \gamma^\lambda \gamma^\rho) R_{\rho \lambda \theta \phi} [\gamma^\theta, \gamma^\phi] = 2(\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\mu \gamma^\lambda \gamma^\rho) \gamma^\theta \gamma^\phi R_{\rho \lambda \theta \phi}. \quad (C.18)
\]

Gamma identity (2.11) and Riemann identities (eqs. (A.1) to (A.3)) allow us to write

\[
\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu R_{\rho \lambda \theta \phi} = 2(g^{\nu \rho} \gamma^\lambda - g^{\nu \rho} \gamma^\mu + g^{\nu \rho} \gamma^\lambda - g^{\mu \lambda} \gamma^\rho) R_{\rho \lambda \theta \phi} \\
- \gamma^\nu \gamma^\mu \gamma^\rho \gamma^\lambda R_{\rho \lambda \theta \phi} \\
= 4(\gamma^\nu \gamma^\rho R_{\rho \theta \phi} + \gamma^\rho \gamma^\mu R_{\rho \theta \phi}) + (2g^{\mu \nu} \gamma^\lambda - \gamma^\nu \gamma^\mu \gamma^\rho) R_{\rho \lambda \theta \phi},
\]

(C.19)

and

\[
\gamma^\nu \gamma^\mu \gamma^\lambda \gamma^\rho R_{\rho \lambda \theta \phi} = (2g^{\rho \lambda} - \gamma^\nu \gamma^\mu \gamma^\rho \gamma^\lambda) R_{\rho \lambda \theta \phi} = -\gamma^\nu \gamma^\mu \gamma^\rho \gamma^\lambda R_{\rho \lambda \theta \phi}. \quad (C.20)
\]

Substituting the expression of eqs. (C.19) and (C.20), and then using the identity eq. (C.16), one can obtain following simplified form of eq. (C.18)

\[
(\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\mu \gamma^\lambda \gamma^\rho) R_{\rho \lambda \theta \phi} [\gamma^\theta, \gamma^\phi] = 8(\gamma^\nu \gamma^\rho \gamma^\theta \gamma^\phi R_{\rho \theta \phi} + \gamma^\rho \gamma^\mu \gamma^\theta \gamma^\phi R_{\rho \mu \theta \phi}) \\
+ 4 (g^{\mu \nu} - \gamma^\nu \gamma^\mu) \gamma^\rho \gamma^\lambda \gamma^\theta \gamma^\phi R_{\rho \lambda \theta \phi} \\
- 8R(\gamma^\rho \gamma^\phi - g^{\rho \phi}). \quad (C.21)
\]

- 18 -
We can follow exactly the same procedure to simplify eq. (C.21) further, and can write

\[ \gamma^\nu \gamma^\rho \gamma^\theta \gamma^\phi R^\mu_{\rho\theta\phi} = \frac{1}{3} \left\{ \gamma^\nu \gamma^\rho \gamma^\theta \gamma^\phi R^\mu_{\rho\theta\phi} + \gamma^\nu \gamma^\rho \gamma^\phi \gamma^\theta R^\mu_{\theta\rho\phi} + \gamma^\nu \gamma^\phi \gamma^\theta \gamma^\rho R^\mu_{\phi\theta\rho} \right\} \]

\[ = \frac{1}{3} \left\{ \gamma^\nu \gamma^\rho \gamma^\theta \gamma^\phi R^\mu_{\rho\theta\phi} + (2g^\phi \gamma^\nu \gamma^\theta - 2g^\theta \gamma^\nu \gamma^\phi + \gamma^\nu \gamma^\rho \gamma^\phi \gamma^\rho \gamma^\phi \gamma^\theta) R^\mu_{\theta\rho\phi} \right\} \]

\[ + (2g^\rho \gamma^\nu \gamma^\phi - 2g^\phi \gamma^\nu \gamma^\rho + \gamma^\nu \gamma^\rho \gamma^\phi \gamma^\theta) R^\mu_{\phi\rho \theta} \]

\[ = \frac{1}{3} \left\{ \gamma^\nu \gamma^\rho \gamma^\theta \gamma^\phi (R^\mu_{\rho\theta\phi} + R^\mu_{\theta\rho\phi} + R^\mu_{\phi\rho\theta}) - 2\gamma^\nu \gamma^\rho \gamma^\phi R^\mu_{\rho\phi} \right\} - 2\gamma^\nu \gamma^\theta \gamma^\rho \gamma^\phi R^\mu_{\theta\rho} \]

\[ = -2\gamma^\nu \gamma^\theta \gamma^\rho \gamma^\phi R^\mu_{\theta\rho}. \]

and

\[ \gamma^\rho \gamma^\theta \gamma^\phi \gamma^\mu R^\nu_{\rho\theta\phi} = 2g^\mu \gamma^\rho \gamma^\phi R^\nu_{\rho\theta\phi} - \gamma^\rho \gamma^\theta \gamma^\phi \gamma^\phi R^\nu_{\rho\phi} \]

\[ = 2\gamma^\mu \gamma^\theta \gamma^\rho \gamma^\phi R^\nu_{\rho\theta} - 2\gamma^\nu \gamma^\theta \gamma^\rho \gamma^\phi R^\mu_{\rho\theta}. \]  

(C.22)

Substituting eqs. (C.22) and (C.23) in eq. (C.21), we find the following result

\[ (\gamma^\rho \gamma^\lambda \gamma^\mu \gamma^\nu + \gamma^\nu \gamma^\rho \gamma^\theta \gamma^\phi) R^\mu_{\rho\lambda\phi} [\gamma^\theta, \gamma^\phi] = 16(-\gamma^\rho \gamma^\theta R^\mu_{\nu\rho\phi} + \gamma^\mu \gamma^\nu R^\mu_{\theta\phi} - \gamma^\nu \gamma^\phi R^\mu_{\theta\rho}) \]

\[ - 8R(\gamma^\mu \gamma^\nu - g^\mu \nu). \]  

(C.24)
