We derive perturbative constraints on the transverse part of the fermion-boson vertex in massive QED3 through its one loop evaluation in an arbitrary covariant gauge. Written in a particular form, these constraints naturally lead us to the first non-perturbative construction of the vertex, which is in complete agreement with its one loop expansion in all momentum regimes. Without affecting its one-loop perturbative properties, we also construct an effective vertex in such a way that the unknown functions defining it have no dependence on the angle between the incoming and outgoing fermion momenta. Such a vertex should be useful for the numerical study of dynamical chiral symmetry breaking, leading to more reliable results.

I. INTRODUCTION

Quantum Electrodynamics in 3-dimensions (QED3) is an attractive model to study the intricacies of Schwinger-Dyson Equations (SDEs). Due to its simplicity as compared to Quantum Electrodynamics in 4-dimensions (QED4) and Quantum Chromodynamics (QCD), the corresponding study of dynamical symmetry breaking is relatively neater in QED3. There exist numerous works both in the quenched and the unquenched approximation in this connection, e.g., [1]- [10]. An excellent review can be found in [11]. As is well known, the knowledge of the 3-point vertex is crucial in such studies. In this respect, perturbation theory is a powerful point of reference as it is natural to believe that physically meaningful solutions of the Schwinger-Dyson equations must agree with perturbative results in the weak coupling regime. This realization has been exploited in [12–15] to derive constraints on the fermion propagator and the three-point vertex in massless QED3. In this paper, we extend this work to the more general massive case, based on [16].

The Ward-Takahashi Identity (WTI) relates the 3-point vertex to the fermion propagator. Using this relation, a part of the vertex, called longitudinal, can be expressed in terms of the fermion propagator [17]. We evaluate this propagator to one-loop and hence determine the longitudinal vertex to the same order. We also calculate the complete vertex to one-loop and a mere subtraction of the longitudinal part yields the transverse part, the one which is not fixed by the WTI. According to the choice of Ball and Chiu, which was later modified by Kızılersü et. al. [18], the transverse vertex can be expressed in terms of 8 independent spin structures. The vertex should be free of any kinematic singularities. Ball and Chiu chose the basis in such a way that the coefficient of each of the basis is independently free of kinematic singularities in the Feynman gauge. It was later shown by Kızılersü et. al. [18] that a calculation similar to that of Ball and Chiu in an arbitrary covariant gauge does not have the same nice feature. Therefore, they proposed a modified basis whose coefficients are free of kinematic singularities in an arbitrary covariant gauge. The calculation in the present paper confirms that all the vectors of the modified basis also retain this feature for massive QED3. The final result for the transverse vertex is written in terms of basic functions of the momenta in a form suitable for its extension to the non-perturbative domain, following the ideas of Curtis and Pennington [19].

Using perturbative constraints as a guide, we carry out a construction of the non-perturbative vertex, which has no explicit dependence on the coupling $\alpha$. This vertex has an explicit dependence on the gauge parameter $\xi$. We demonstrate in the massless case that a vertex cannot be constructed without an explicit dependence on $\xi$. For practical purposes of the numerical study of dynamical chiral symmetry breaking, we also construct an effective vertex which shifts the angular dependence from the unknown fermion propagator functions to the known basic functions, without changing its perturbative properties at the one-loop level. We believe that this vertex should lead to a more realistic study of the dynamically generated masses through the corresponding SDEs.
One-loop fermion propagator can be obtained by evaluating the graph in Fig. 1. This graph corresponds to the following equation:

\[ iS_F^{-1}(p) = iS_F^0(p) + e^2 \int \frac{d^3k}{(2\pi)^3} \gamma^\mu S_F^0(k) \gamma^\nu \Delta_\mu^\nu(q) , \] (2.1)

where \( q = k - p \) and \( e \) is the QED coupling constant. The bare fermion and photon propagators are, respectively:

\[ S_F^0(p) = \frac{1}{p - m} , \]
\[ \Delta_\mu^\nu(q) = - \left[ q^2 g_{\mu\nu} + (\xi - 1)q_{\mu}q_{\nu} \right] / q^4 , \] (2.2)

where \( m \) is the bare mass of the fermion and \( \xi \) is the covariant gauge parameter. We define the full fermion propagator \( S_F(p) \) in the most general form as:

\[ S_F(p) = \frac{F(p^2)}{p - M(p^2)} . \] (2.3)

Taking the trace of Eq. (2.1), having multiplied it with \( p \) and with 1 respectively, one can obtain two independent equations. On simplifying, these equations can be written as:

\[ \frac{1}{F(p^2)} = 1 + i4\pi\alpha\xi \frac{1}{p^2} \int \frac{d^3k}{(2\pi)^3} \frac{1}{q^4(k^2 - m^2)} \left[ (k^2 + p^2)k \cdot p - 2k^2p^2 \right] , \] (2.4)
\[ \frac{M(p^2)}{F(p^2)} = m - i4\pi\alpha (\xi + 2) \int \frac{d^3k}{(2\pi)^3} \frac{m}{q^2(k^2 - m^2)} , \] (2.5)

where \( \alpha = e^2/4\pi \). On Wick rotating to the Euclidean space and carrying out angular and radial integrations, we arrive at:

\[ \frac{1}{F(p^2)} = 1 - \frac{\alpha\xi}{2p^2} [m - (m^2 + p^2) I(p^2)] , \]
\[ \frac{M(p^2)}{F(p^2)} = m [1 + \alpha(\xi + 2) I(p^2)] , \] (2.6)

where we have used the simplifying notation \( I(p^2) = (1/\sqrt{-p^2}) \arctan \sqrt{-p^2/m^2} \). Equations (2.3) and (2.6) form the complete fermion propagator at one loop.

B. Longitudinal Vertex to One Loop

The full vertex satisfies WTI:

\[ q_\mu \Gamma^\mu(k, p) = S_F^{-1}(k) - S_F^{-1}(p) . \] (2.7)

This relation allows us to decompose the full vertex into longitudinal \((\Gamma_L^\mu(k, p))\) and transverse \((\Gamma_T^\mu(k, p))\) parts:

\[ \Gamma^\mu(k, p) = \Gamma_L^\mu(k, p) + \Gamma_T^\mu(k, p) , \] (2.8)

where the transverse part satisfies

\[ q_\mu \Gamma_T^\mu(k, p) = 0 \quad \text{and} \quad \Gamma_T^\mu(p, p) = 0 \] (2.9)
and hence remains undetermined by WTI. Following the work of Ball and Chiu, we can define the longitudinal
component of the vertex in terms of the fermion propagator as
\[
\Gamma^\mu_L = \frac{\gamma^\mu}{2} \left[ \frac{1}{F(k^2)} + \frac{1}{F(p^2)} \right] + \frac{1}{2} \frac{1}{F(k^2) - F(p^2)} \left[ \frac{1}{F(k^2)} - \frac{1}{F(p^2)} \right] + \frac{(k+p)^\mu}{(k^2-p^2)} \left[ \frac{M(k^2)-M(p^2)}{F(k^2)-F(p^2)} \right].
\] (2.10)

On substituting Eq. (2.6) into the above expression, we obtain
\[
\Gamma^\mu_L = \left[ 1 + \frac{\alpha \xi}{4 \sigma_1} \right] \gamma^\mu + \frac{\alpha \xi}{4 \sigma_2} [k^\mu \not{k} + p^\mu \not{p} + k^\mu \not{p} + p^\mu \not{k}] + \alpha (\xi + 2) \sigma_3 [k^\mu + p^\mu],
\] (2.11)

where
\[
\sigma_1 = \frac{m^2 + k^2}{k^2} I(k^2) + \frac{m^2}{p^2} I(p^2) - \frac{k^2 + p^2}{k^2 p^2},
\]
\[
\sigma_2 = \frac{1}{k^2 - p^2} \left[ \frac{m^2 + k^2}{k^2} I(k^2) - \frac{m^2 + p^2}{p^2} I(p^2) + \frac{k^2}{k^2 p^2} \right],
\]
\[
\sigma_3 = m \left[ I(k^2) - I(p^2) \right].
\] (2.12)

Eqs. (2.11) and (2.12) give the longitudinal part of the fermion-photon vertex to one loop for the massive QED3.

### C. Transverse Vertex to One-Loop

The vertex of Fig. 2 can be expressed as
\[
\Gamma^\mu(k, p) = \gamma^\mu + \Lambda^\mu.
\] (2.13)

Using the Feynman rules, \( \Lambda^\mu \) to \( O(\alpha) \) is simply given by :
\[
-ie\Lambda^\mu = \int_M \frac{d^3w}{(2\pi)^3} \left(-ie\gamma^\alpha iS^0_F(p-w)(-ie\gamma^\mu)iS^0_F(k-w)(-ie\gamma^\beta)i\Delta^0_{\alpha\beta}(w)\right),
\] (2.14)

where the loop integral is to be performed in Minkowski space. \( \Lambda^\mu \) can be expressed as :
\[
\Lambda^\mu = -\frac{i}{2\pi^2} \left\{ \gamma^\alpha \not{p} \gamma^\mu \not{k} \gamma_\alpha + m(4k^\mu + 4p^\mu - \not{p} \gamma^\mu - \gamma^\mu \not{k}) - m^2 \gamma^\mu \right\} J^{(0)}
\]
\[
- \left[ \gamma^\alpha \not{k} \gamma^\nu \gamma_\alpha + \gamma^\alpha \gamma^\nu \gamma^\mu \gamma_\alpha + 6mg^{\mu\nu} \right] J^{(1)}_{\nu}\lambda
\]
\[
+ (\xi - 1) \left[ \gamma^\mu K^{(0)} - \left[ \gamma^\nu \not{p} \gamma^\mu + \gamma^\mu \not{k} \gamma^\nu + 2mg^{\mu\nu} \right] J^{(1)}_{\nu}\lambda
\]
\[
+ \left[ \gamma^\nu \not{p} \gamma^\mu \not{k} \gamma^\lambda + m(\gamma^\nu \not{p} \gamma^\mu \gamma^\lambda + \gamma^\nu \gamma^\mu \not{k} \gamma^\lambda) + m^2 \gamma^\nu \gamma^\mu \gamma^\lambda \right] I^{(2)}_{\nu\lambda} \right\},
\] (2.15)

where the integrals \( K^{(0)}, J^{(0)}, J^{(1)}_{\mu}, J^{(2)}_{\mu\nu}, I^{(0)}, I^{(1)}_{\mu} \) and \( I^{(2)}_{\mu\nu} \) are :
\[
K^{(0)} = \int_M d^3w \frac{1}{[(p-w)^2 - m^2][(k-w)^2 - m^2]}
\]
\[
J^{(0)} = \int_M d^3w \frac{1}{w^2[(p-w)^2 - m^2][(k-w)^2 - m^2]}
\]
\[
J^{(1)}_{\mu} = \int_M d^3w \frac{w_\mu}{w^2[(p-w)^2 - m^2][(k-w)^2 - m^2]}
\]
\[
J^{(2)}_{\mu\nu} = \int_M d^3w \frac{w_\mu w_\nu}{w^2[(p-w)^2 - m^2][(k-w)^2 - m^2]}
\]
\[ I^{(0)} = \int_{M} d^{3}w \frac{1}{w^{4}([p-w]^{2} - m^{2})([k-w]^{2} - m^{2})} \]
\[ I^{(1)}_{\mu} = \int_{M} d^{3}w \frac{w_{\mu}}{w^{4}([p-w]^{2} - m^{2})([k-w]^{2} - m^{2})} \]
\[ I^{(2)}_{\mu\nu} = \int_{M} d^{3}w \frac{w_{\mu}w_{\nu}}{w^{4}([p-w]^{2} - m^{2})([k-w]^{2} - m^{2})} . \]

(2.16)

We evaluate these integrals following the techniques developed in [12,13,17,18]. The results are tabulated in the appendix, employing the notation \( \Delta^{2} = (k \cdot p)^{2} - k^{2}p^{2} \) and \( X_{0} = (2/i\pi^{2})X^{(0)} \) for \( X = I, J, K \). Having calculated the vertex to \( O(\alpha) \), Eq. (2.15), we can subtract from it the longitudinal vertex, Eqs. (2.11) and (2.12), and obtain the transverse vertex to \( O(\alpha) \). Following the scheme provided by Ball and Chiu [17], and modified later by Kızılers¨u et. al. [18], the transverse vertex \( \Gamma^{\mu}_{T}(k,p) \) can be written in terms of 8 basis vectors as follows:

\[ \Gamma^{\mu}_{T}(k,p) = \sum_{i=1}^{8} \tau_{i}(k^{2},p^{2},q^{2})T^{i}_{\mu}(k,p) , \]

(2.17)

where

\[
T^{\mu}_{1} = [p^{\mu}(k \cdot q) - k^{\mu}(p \cdot q)] \\
T^{\mu}_{2} = [p^{\mu}(k \cdot q) - k^{\mu}(p \cdot q)] (k + p) \\
T^{\mu}_{3} = q^{2}\gamma^{\mu} - q^{\mu} \delta \\
T^{\mu}_{4} = q^{2}[\gamma^{\mu}(k + p) - k^{\mu} - p^{\mu}] - 2(k - p)^{\mu}k^{\nu}\sigma_{\nu} \\
T^{\mu}_{5} = \eta_{\mu}^{\nu}\delta \\
T^{\mu}_{6} = -\gamma^{\mu}(k^{2} - p^{2}) + (k + p)^{\mu} \delta \\
T^{\mu}_{7} = -\frac{1}{2}(k^{2} - p^{2})[\gamma^{\mu}(k + p) - k^{\mu} - p^{\mu}] + (k + p)^{\mu}k^{\nu}\sigma_{\nu} \\
T^{\mu}_{8} = -\gamma^{\mu}k^{\nu}\sigma_{\nu\lambda} + k^{\mu} \delta - p^{\mu} \delta ,
\]

with \( \sigma_{\mu\nu} = \frac{1}{2}[\gamma_{\mu},\gamma_{\nu}] \).

(2.18)

After a lengthy but straightforward algebra, the coefficients \( \tau_{i} \) can be identified. We prefer to write these out in the following form:

\[ \tau_{i}(k,p) = \alpha \eta_{i} \left[ \sum_{j}^{5} a_{ij}(k,p)l_{j}^{(2)} + \frac{a_{0}(k,p)}{k^{2}p^{2}} \right] \]

(2.19)

where \( l_{1}^{2} = \eta_{1}^{2} \chi/4, l_{2}^{2} = \eta_{2}^{2} \chi/4, l_{3}^{2} = k^{2}, l_{4}^{2} = p^{2} \) and \( l_{5}^{2} = q^{2}/4. \) Functions \( \eta_{1}, \eta_{2} \) and \( \chi \) have been defined in the appendix, Eqs. (4.2). Similarly, the factors \( g_{i} \) are \( -g_{1} = m\Delta^{2}g_{2} = 2m\Delta^{2}g_{3} = 2\Delta^{2}g_{4} = g_{5} = 2m\Delta^{2}g_{6} = \Delta^{2}g_{7} = mg_{8} = m/4\Delta^{2}. \) The coefficients \( a_{ij}(k,p) \) have also been tabulated in the appendix, Eqs. (4.14). An important point to note is that these coefficients do not contain any trigonometric function, as it has been extracted out for raising the \( \tau_{i} \) to a non-perturbative status. The \( \tau_{i} \) have the required symmetry under the exchange of vectors \( k \) and \( p. \) All the \( \tau_{i} \) are symmetric except \( \tau_{4} \) and \( \tau_{6} \) which are antisymmetric. Note that the form in which we write the transverse vertex makes it clear that each term in all the \( \tau_{i} \) is either proportional to \( \alpha I(l_{i}^{2}) \) or \( \alpha/(k^{2}p^{2}). \) We shall see that this form provides us with a natural scheme to arrive at its simple non-perturbative extension.

A few comments in comparison with the work by Davydychev et. al. [19], are as follows: (i) None of the \( \tau_{i} \) have calculated has kinematic singularity when \( k^{2} \rightarrow p^{2} \). This clearly suggests that the choice of the \( \tau_{i} \) suggested by Kızılers¨u et. al. is preferred over the one of Ball and Chiu (in QED3 as well) used by Davydychev et. al. [19]. In particular our \( \tau_{4} \) and \( \tau_{6} \) are independent of kinematic singularities. (ii) In three dimensions, their factorization of the common constant factor in Eq. (E.1) is singular. However, as the divergences completely cancel out, we find our expressions more suitable for writing the transverse vertex in three dimensions. (iii) With the way we express \( J_{0}, \) all the \( \tau_{i} \) are written in terms of basic functions of \( k \) and \( p \) and a single trigonometric function of the form \( I(l_{i}^{2}) \). This form plays a key role to enable us to make an easy transition to the possible non-perturbative structure of the vertex, as explained in the next section. Moreover, with the given form of \( J_{0}, \) a direct comparison can be made with the massless case.
A. On the Gauge Parameter Dependence of the Vertex

Let us first look at the $\tau_i$ in the simplified massless case, with the notation $k = \sqrt{-k^2}$, $p = \sqrt{-p^2}$ and $q = \sqrt{-q^2}$ [12,13],

$$
\begin{align*}
\tau_2 &= \frac{\alpha \pi}{4} \frac{1}{kp(k+p)(k+p+q)^2} \left[ 1 + (\xi - 1) \frac{2k + 2p + q}{q} \right], \\
\tau_3 &= \frac{\alpha \pi}{8} \frac{1}{kpq(k+p+q)^2} \left[ 4kp + 3kq + 3pq + 2q^2 + (\xi - 1) (2k^2 + 2p^2 + kq + pq) \right], \\
\tau_6 &= \frac{\alpha \pi (2 - \xi)}{8} \frac{k - p}{kp(k+p+q)^2}, \\
\tau_8 &= \frac{\alpha \pi (2 + \xi)}{2} \frac{1}{kp(k+p+q)}. 
\end{align*}
$$

It is interesting to note that the existence of the factor

$$
\frac{k - p}{kp} = - \left( \frac{1}{k} - \frac{1}{p} \right)
$$

in Eq. (3.3) puts $\tau_6$ on a different footing as compared to the rest of the $\tau_i$. The reason is that in the massless limit, the fermion propagator is simply

$$
\frac{1}{F(p^2)} = 1 + \pi \alpha \xi \frac{1}{4} p,
$$

implying

$$
\frac{1}{F(k^2)} - \frac{1}{F(p^2)} \propto \left[ \frac{1}{k} - \frac{1}{p} \right].
$$

Therefore, the relation of $\tau_6$ with the fermion propagator of the type $[1/F(k^2) - 1/F(p^2)]$ seems to arise rather naturally :

$$
\tau_6 = -\frac{1}{2\xi} \frac{2 - \xi}{(k + p + q)^2} \left[ \frac{1}{F(k^2)} - \frac{1}{F(p^2)} \right], 
$$

as noticed first by Curtis and Pennington [20]. In the rest of the $\tau_i$, the factor $1/k - 1/p$ does not arise. However, one could introduce it by hand to arrive at the following expressions :

$$
\begin{align*}
\tau_2 &= -\frac{1}{\xi} \frac{1}{(k^2 - p^2)(k + p + q)^2} \left( 1 + (\xi - 1) \frac{2k + 2p + q}{q} \right) \left[ \frac{1}{F(k^2)} - \frac{1}{F(p^2)} \right], \\
\tau_3 &= -\frac{1}{2\xi} \frac{1}{q(k - p)(k + p + q)^2} \left[ 4kp + 3kq + 3pq + 2q^2 + (\xi - 1) (2k^2 + 2p^2 + kq + pq) \right] \left[ \frac{1}{F(k^2)} - \frac{1}{F(p^2)} \right], \\
\tau_8 &= -\frac{2(2 + \xi)}{\xi} \frac{1}{(k - p)(k + p + q)} \left[ \frac{1}{F(k^2)} - \frac{1}{F(p^2)} \right].
\end{align*}
$$

Eqs. (3.5-3.8) represent a non-perturbative vertex which is in agreement with its complete one-loop expansion. This vertex has been constructed in accordance with the form advocated, e.g., in [2,20,21]. There are a couple of important points which need to be discussed here:

- There is an explicit dependence on the gauge parameter, $\xi$. A widespread belief has been that the gauge dependence of the vertex should solely arise through functions $F(k^2)$ and $F(p^2)$, and there should be no explicit appearance of the gauge parameter $\xi$. Such a belief has been expressed (or is reflected) in various works to date, e.g., [2,3,10,20,21]. Here we show that at least in massless QED3, such a construction is not possible.
We notice that at the one-loop level, each of the \( \tau \) is unavoidable in massless QED3. We now show that the explicit dependence of the vertex on the gauge parameter \( \xi \) is unavoidable in massless QED3. We notice that at the one-loop level, each of the \( \tau \) can be written in the following form:

\[
\tau_i(k, p, q) = \alpha \xi a_i(k, p, q) + \alpha b_i(k, p, q) .
\]

On the other hand, Eq. (2.6) yields the following form for \( F \):

\[
\frac{1}{F(p^2)} = 1 + \alpha \xi c_i(p) .
\]

If we want to write the non-perturbative form of the \( \tau \) in terms of \( 1/F(p^2) \) and \( 1/F(k^2) \) alone and we do not expect explicit presence of \( \alpha \), the only way to get rid of \( \xi \) dependence is to have

\[
b_2 T_2^\mu + b_3 T_3^\mu + b_6 T_6^\mu + b_8 T_8^\mu = 0 .
\]

It is not possible as \( T_\mu^I \) form a linearly independent set of basis vectors. Therefore, any construction of the 3-point vertex will surely have an explicit dependence on the gauge parameter. Owing to these reasons, we realize that to demand the transverse vertex to be proportional to \( 1/F(k^2) - 1/F(p^2) \) is artificial (apart from \( \tau_6 \)) and is not required. Therefore, we do not pursue this line of action anymore. In the next section, we move on to construct the vertex for the massive case inspired from our perturbative results.

**B. Non-perturbative Vertex**

As pointed out in the previous section, each term in all the \( \tau \) is either proportional to the trigonometric function \( \alpha I(I^2) \) or \( \alpha/(k^2 p^2) \). On the other hand, the perturbative expressions for \( \mathcal{M}(p^2) \) and \( F(p^2) \), Eqs. (2.6), permit us to write:

\[
\frac{1}{F(k^2)} - \frac{1}{F(p^2)} = \frac{\alpha}{k^2 p^2} \xi \left[ k^2 \{ m - (m^2 + p^2)I(p^2) \} - p^2 \{ m - (m^2 + k^2)I(k^2) \} \right] \tag{3.9}
\]

and

\[
\frac{\xi}{2(2 + \xi)I(l^2)} \left[ \frac{\mathcal{M}(l^2)}{F(l^2)} - m \right] - \left[ 1 - \frac{1}{F(l^2)} \right] = \frac{\xi(m^2 + l^2)}{2l^2} \alpha I(l^2) . \tag{3.10}
\]

In the massless limit, Eq. (3.9) simply reduces to

\[
\frac{1}{F(k^2)} - \frac{1}{F(p^2)} = \frac{\alpha \pi \xi}{4} \left[ \frac{1}{k} - \frac{1}{p} \right]
\]

in the Euclidean space, as expected. It was in fact an analogous massless expression in the limit when \( k \gg p \) that inspired Curtis and Pennington, [20], to propose their famous vertex in QED4. Here, we are extending the reasoning to all the momentum regimes in the massive QED3. Fortunate simultaneous occurrence of the factor \( \alpha/(k^2 p^2) \) in all the 8 Eqs. (2.19) and Eq. (3.9), and the presence of the same trigonometric factor \( I(l^2) \) in the expressions for the vertex as well as the propagator, one naturally arrives at the following non-perturbative form of \( \tau \) :
\[ \tau_i = g_i \left\{ \sum_{j=1}^{5} \left( \frac{2a_{ij}(k,p)\xi p_j^2}{\xi (m^2 + \kappa_j^2)} \left[ \frac{\xi}{2(\xi + 2)\kappa_j^2 F(\kappa_j^2)} \left( \frac{M(\kappa_j^2)}{F(\kappa_j^2)} - m \right) - \left( 1 - \frac{1}{F(\kappa_j^2)} \right) \right] \right) \right\} + \frac{2a_{i6}(k,p)}{\xi [k^2 \{ m - (m^2 + p^2)I(p^2) \} - p^2 \{ m - (m^2 + k^2)I(k^2) \}] \left[ \frac{1}{F(k^2)} - \frac{1}{F(p^2)} \right]} \right\} \quad (3.11) \]

By construction, in the weak coupling regime, this non-perturbative form of the transverse vertex reduces to its corresponding Feynman expansion at the one loop level in an arbitrary covariant gauge and in all momentum regimes. We would like to emphasize that this is not a unique non-perturbative construction. However, it is probably the most natural and the simplest. A two loop calculation similar to the one presented in our paper, and the Landau-Khalatnikov transformation law for the vertex should serve as tests of Eq. (3.11) or guides for improvement towards the hunt for the exact non-perturbative vertex. On practical side, the use of our perturbation theory motivated Khalatnikov transformation law for the vertex should serve as tests of Eq. (3.11) or guides for improvement towards the most natural and the simplest. A two loop calculation similar to the one presented in our paper, and the Landau-

\[ \tau_i = g_i \left\{ \sum_{j=1}^{5} \left( \frac{2b_{ij}(k,p)\xi p_j^2}{\xi (m^2 + \kappa_j^2)} \left[ \frac{\xi}{2(\xi + 2)\kappa_j^2 F(\kappa_j^2)} \left( \frac{M(\kappa_j^2)}{F(\kappa_j^2)} - m \right) - \left( 1 - \frac{1}{F(\kappa_j^2)} \right) \right] \right) \right\} + \frac{2a_{i6}(k,p)}{\xi [k^2 \{ m - (m^2 + p^2)I(p^2) \} - p^2 \{ m - (m^2 + k^2)I(k^2) \}] \left[ \frac{1}{F(k^2)} - \frac{1}{F(p^2)} \right]} \right\} \quad (3.15) \]

where \( \kappa_1^2 = k^2 \) and \( \kappa_2^2 = p^2 \).

**IV. CONCLUSIONS**

In this paper, we calculate one loop fermion-boson vertex in QED3 in an arbitrary covariant gauge and write out the result in a form which naturally allows us to construct its non-perturbative counterpart. This is the first construction of the non-perturbative vertex which agrees with its Feynman expansion in the weak coupling regime at the one loop level in all momentum regimes and in arbitrary covariant gauge. For practical numerical purposes, we also suggest a simple effective vertex which shifts its angular dependence (angle between the incoming and outgoing fermion momenta) from the fermion functions to the known basic functions of the momenta involved, without affecting its perturbative properties at the one-loop level. Currently, the work is underway to use this vertex in numerical calculations of dynamical mass generation for the fundamental fermions. We also plan to compare its gauge dependence against the one demanded by its Landau-Khalatnikov transformation \[22,23\] in a non-perturbative fashion.

**ACKNOWLEDGEMENTS**

A.B. wishes to thank A. Kızılersü with whom initial ideas of the work were discussed. We are grateful to A.I. Davydychev for answering a query. We acknowledge the CIC and the Conacyt grants under the projects 4.12 and 32395-E, respectively.
Following are the results of the integrals listed in Eqs. (2.16):

**$J^{(0)}$:**

$$J_0 = \left[ -\eta_1(k,p)I_0 \left( \frac{n^2}{4} \right) + \eta_2(k,p)I_1 \left( \frac{n^2}{4} \right) \right],$$

with

$$\eta_1(k,p) = -\left\{ \frac{m^2(k^2 - p^2)(2m^2 - k^2 - p^2) + \chi}{\chi(m^2 - k^2)} \right\},$$

$$\eta_2(k,p) = -\eta_1(k,p),$$

$$\chi = m^2(k^2 - p^2)^2 + q^2(k^2 - m^2)(p^2 - m^2).$$

**$K^{(0)}$:**

$$K^{(0)} = i\pi^2 I(q^2/4).$$

**$J^{(1)}_{\mu}$:**

$$J^{(1)}_{\mu} = \frac{i\pi^2}{2} \left\{ k_\mu A(k,p) + p_\mu B(k,p) \right\},$$

where

$$A(k,p) = -\frac{2}{\Delta^2}\left\{ \left[ p^2(k^2 - k \cdot p) - m^2(p^2 - k \cdot p) \right] \frac{J_0}{4} + k \cdot p I(k^2) - p^2 I(p^2) + \frac{1}{2} (p^2 - k \cdot p) I(q^2/4) \right\},$$

$$B(k,p) = A(p,k).$$

**$J^{(2)}_{\mu\nu}$:**

$$J^{(2)}_{\mu\nu} = \frac{i\pi^2}{2} \left\{ \frac{g_{\mu\nu} - k^2}{3} J_0 K_0 + \left( k_\mu k_\nu - g_{\mu\nu} \frac{k^2}{3} \right) J_C + \left( p_\mu k_\nu + k_\mu p_\nu - g_{\mu\nu} \frac{2k \cdot p}{3} \right) J_D + \left( p_\mu p_\nu - g_{\mu\nu} \frac{p^2}{3} \right) J_E \right\},$$

where

$$J_C(k,p) = \frac{1}{\Delta^2} \left\{ \left[ p^2(k \cdot p - 2k^2) - m^2(k \cdot p - 2p^2) \right] \frac{J_A}{2} - p^2(p^2 - m^2) \frac{J_B}{2} \right\},$$

$$+ \frac{k \cdot p}{k^2} \left( m^2 - k^2 \right) I(k^2) + \frac{1}{2} (k \cdot p + p^2) I(q^2/4) - \frac{m k \cdot p}{k^2},$$

$$J_D(k,p) = \frac{1}{2\Delta^2} \left\{ \left[ k^2(3k \cdot p - p^2) - m^2(3k \cdot p - k^2) \right] \frac{J_A}{2} + \left[ p^2(3k \cdot p - k^2) - m^2(3k \cdot p - p^2) \right] \frac{J_B}{2} \right\},$$

$$- (m^2 - k^2) I(k^2) - (m^2 - p^2) I(p^2) - \frac{1}{2} (k + p)^2 I(q^2/4) + 2m \right\},$$

$$J_E(k,p) = J_C(p,k).$$

**$I^{(0)}$:**

$$I^{(0)} = \frac{1}{\chi} \left\{ q^2(m^2 + k \cdot p) J^{(0)} + i\pi^2 mL \right\},$$

where
The coefficients $\mu_{\nu}$ are tabulated below:

\[ a_{ij} = \begin{cases} 
-\xi \eta_1 (m^2 + k \cdot p) & i,j = 1,1 \\
0 & i,j = 2,2 \\
4(\xi + 2) \frac{(k^2 + k \cdot p)}{(k^2 - p^2)} & i,j = 3,3 \\
-2(\xi + 2) & i,j = 4,4 \\
0 & i,j = 5,5,6,6 \\
\end{cases} \]

The coefficients $a_{ij}$ in the one loop perturbative expansion of the $\tau_i$, Eq. (2.19), are tabulated below:

\[
\begin{align*}
I_{\mu}^{(1)} &= \frac{i\pi^2}{2} [k_{\mu}I_A(k,p) + p_{\mu}I_B(k,p)] , \\
I_{\mu\nu}^{(2)} &= \frac{i\pi^2}{2} \left( \frac{g_{\mu\nu}}{3} J_0 + \left( k_{\mu}k_{\nu} - g_{\mu\nu} \frac{k^2}{3} \right) I_C + \left( p_{\mu}k_{\nu} + k_{\mu}p_{\nu} - g_{\mu\nu} \frac{2k \cdot p}{3} \right) I_D + \left( p_{\mu}p_{\nu} - g_{\mu\nu} \frac{p^2}{3} \right) I_E \right) ,
\end{align*}
\]
\[ a_{23}(k, p) = \frac{1}{(k^2 + p^2)^2} \left[ \xi \left\{ (k \cdot p)^3 + k^2(k \cdot p)^2 - 3k^2p^2k \cdot p + 2k^4k \cdot p + k^4p^2 - 2k^6 \right\} m^2/k^2 + (k \cdot p)^3 + (2k^2 - p^2)(k \cdot p)^2 + k^2p^2k \cdot p - 2k^4k \cdot p - k^2p^4 + (\xi - 1) \left\{ (k \cdot p)^3 + p^2(k \cdot p)^2 - 3k^2p^2k \cdot p + 2k^4k \cdot p + k^2p^4 - 2k^2p^4 \right\} \right] \]

\[ a_{24}(k, p) = a_{23}(p, k) \]

\[ a_{25}(k, p) = q^2(m^2 + k \cdot p) + (\xi - 1)(q^2m^2 + (k \cdot p)^2 - (k^2 + p^2)k \cdot p + k^2p^2) \]

\[ a_{26}(k, p) = m\Delta^2 \left\{ k \cdot p + \frac{(\xi - 1)}{\chi} \left[ q^2k \cdot pm^4 + 2(k^2 + p^2)\Delta^2m^2 - k^2p^2 \left\{ 2(k \cdot p)^2 + (k^2 + p^2)k \cdot p - 4k^2p^2 \right\} \right] \right\} \]

\[ a_{31}(k, p) = -\frac{\eta_1}{2} \left\{ \left\{ -2k^2 + k^4 + p^4 \right\} m^4 + 2 \left\{ (k^2 + p^2)(k \cdot p)^2 + (k^2 - p^2)(k \cdot p) - k^2p^2(k^2 + p^2) \right\} m^2 + \frac{1}{2} \left\{ -4(k \cdot p)^4 + (k^2 + p^2)^2(k \cdot p)^2 + k^2p^2(k^2 - p^2)^2 \right\} \right\} \]

\[ a_{32}(k, p) = a_{31}(p, k) \]

\[ a_{33}(k, p) = \xi \left\{ (k \cdot p)^3 - k^2(k \cdot p)^2 - 3k^2p^2k \cdot p + 2k^4k \cdot p - k^4p^2 + 2k^6 \right\} m^2/k^2 + (\xi - 2) \left\{ (k \cdot p)^3 - (2k^2 - p^2)(k \cdot p)^2 + k^2p^2k \cdot p - 2k^4k \cdot p + k^3p^2 \right\} \]

\[ a_{34}(k, p) = a_{33}(p, k) \]

\[ a_{35}(k, p) = -(k^4 + p^4 - 2(k \cdot p)^2) \left[ \xi m^2 + (\xi - 2)k \cdot p \right] \]

\[ a_{36}(k, p) = -m\Delta^2 \left\{ k \cdot p(k^2 + p^2) + 2k^2p^2 + \frac{(\xi - 1)}{\chi} \left[ q^2 \left\{ (k^2 + p^2)(k \cdot p) - 2k^2p^2(k \cdot p) \right\} m^2 - \frac{1}{2}k^2p^2 \left\{ (k^2 + p^2)(k \cdot p)^2 - k^2p^2(k^2 + p^2) \right\} \right] \right\} \]

\[ a_{41}(k, p) = -\frac{\eta_1(\xi - 1)}{2} \frac{(k^2 + p^2)^2}{2\chi} \left[ -q^4m^6 + 3q^2 \left\{ -(k^2 + p^2)(k \cdot p) + 2k^2p^2 \right\} m^4 \right.

\left. + \left\{ (k \cdot p)^2[4(k \cdot p)^2 - 3k^4 - 3p^4 - 26k^2p^2] + k^2p^2[24(k^2 + p^2)(k \cdot p) - 3k^4 - 3p^4 - 14k^2p^2) \right\} \right\} m^2/2 \]

\[ a_{42}(k, p) = -a_{41}(p, k) \]

\[ a_{43}(k, p) = \frac{(\xi - 1)}{k^2} \left\{ (k^2 + k \cdot p)(k \cdot p)^2 + k^2(2k^2 - 3p^2)(k \cdot p) + k^4(p^2 - 2k^2) \right\} \]

\[ a_{44}(k, p) = -a_{43}(p, k) \]

\[ a_{45}(k, p) = (\xi - 1)(k^2 - p^2)q^2 \]

\[ a_{46}(k, p) = m(\xi - 1)(k^2 - p^2) \frac{\Delta^2}{\chi} \left[ q^2k \cdot pm^2 + 2(k^2 + p^2)(k \cdot p)^2 - 2k^2p^2(k \cdot p) - k^2p^2(k^2 + p^2) \right] \]
\[ a_{51}(k, p) = -\eta \left\{ \Delta^2 + \frac{(\xi - 1)}{4\chi} \left[ -2q^2m^6 + 6q^2 \left\{ 2k^2p^2 - (k^2 + p^2)k \cdot p \right\} m^4 - 6k^2p^2q^2m^2 \\
