Combinatorial coherent states via
Pawel Blasiak†‡ Karol A. Penson† Allan I. Solomon‡§ Université Pierre et Marie Curie

abstract We construct and analyze a family of coherent states built on sequences of integers originating from the solution of the boson normal ordering problem. These sequences generalize the conventional combinatorial Bell numbers and are shown to be moments of positive functions. Consequently, the resulting coherent states automatically satisfy the resolution of unity condition. In addition they display such non-classical fluctuation properties as super-Poissonian statistics and squeezing.
