The figure shows a comparison between experimental and theoretical predictions for the ratio of data to theory as a function of jet pseudorapidity ($|y| < 0.5$). The CMS Preliminary analysis uses 5.43 pb$^{-1}$ of data at 2.76 TeV. The graph includes data points with experimental uncertainties and theoretical predictions represented by solid and dashed lines. The CT10 NLO $\otimes$ NP calculations are shown for the jet $p_T$ distribution.
